Science: The Basic Ideas

The laws of nature apply at all locations in the Universe, from your home to Paris to the most distant galaxies

These laws apply at all times from the Beginning to now and throughout the future

"... the **universality** and **immutability** of the fundamental **laws** is the basic postulate of all science."*

Nature follows foundational laws that humans can understand.

* Quinn, H. (2007, January). "Belief and knowledge — a plea about language." *Physics Today* Vol. 60, Iss. 1, pp. 8–9.

Science: The Method

"**scientific method** *n*. a method of procedure that has characterized natural science since the 17th century, consisting in systematic observation, measurement, and experiment, and the formulation, testing, and modification of hypotheses."*

- ✶Ask a question
- ✶Formulate a hypothesis (testable answer)
- ✶Make a prediction
- ✶Test the prediction
- ✶Verify, Modify, or Reject Hypothesis
- ✶Repeat

* *The Oxford English Dictionary* Online

Scientific Notation

✳Electron mass = 0.000000000000000000000000000091 g

✳To express very large or small numbers, we use the notation

10^x = 1 followed by x zeroes.

$10^9 = 1,000,000,000$

$$10^{-9} = \frac{1}{1,000,000,000} = 0.000000001$$

For Example

World Population = 7.08 billion = 7,080,000,000 = 7.08×10^9

Electron Mass = 9.1×10^{-28} g

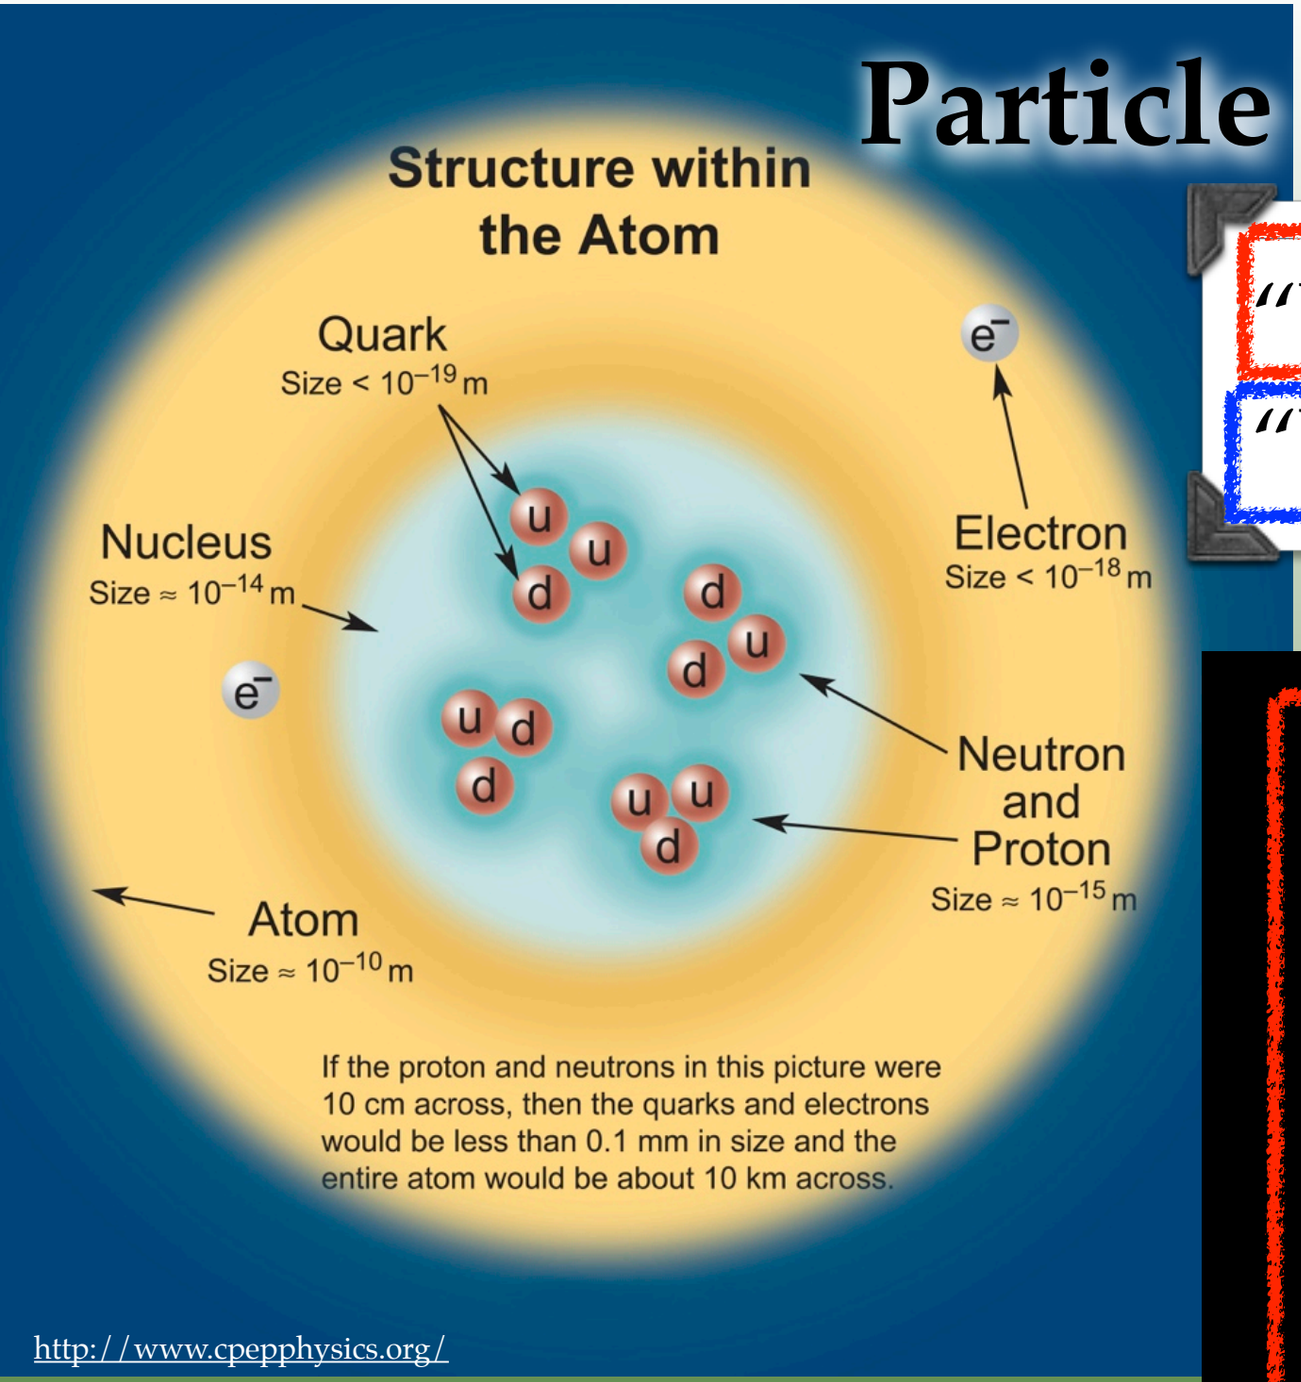
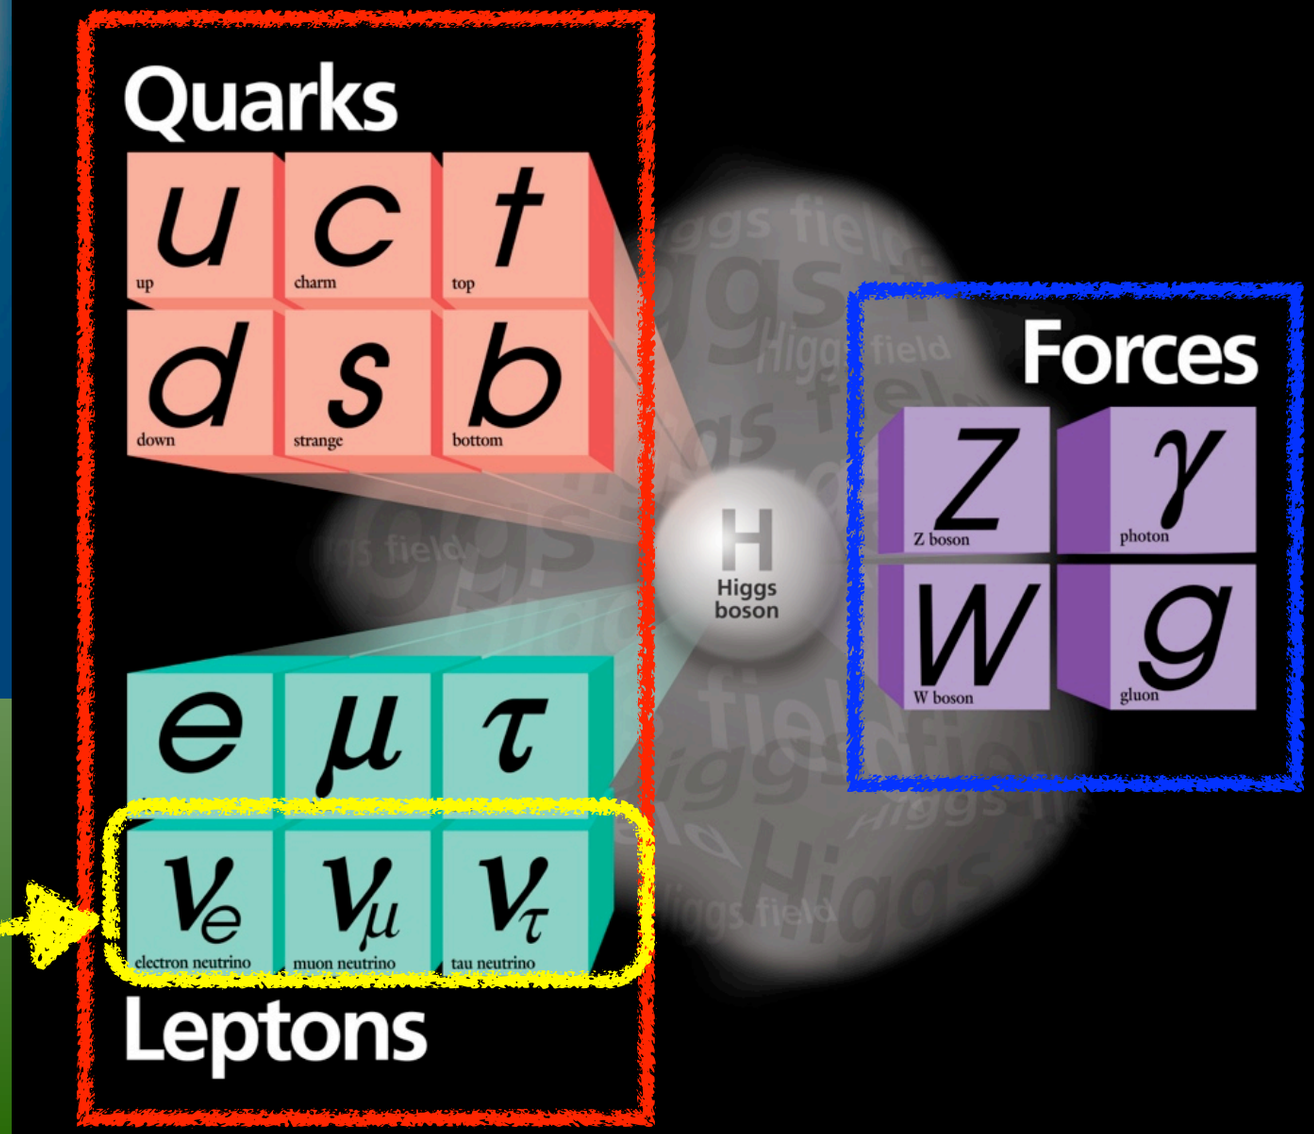
Particle Physics



http://www.cpepphysics.org/

"What is the world made of?"

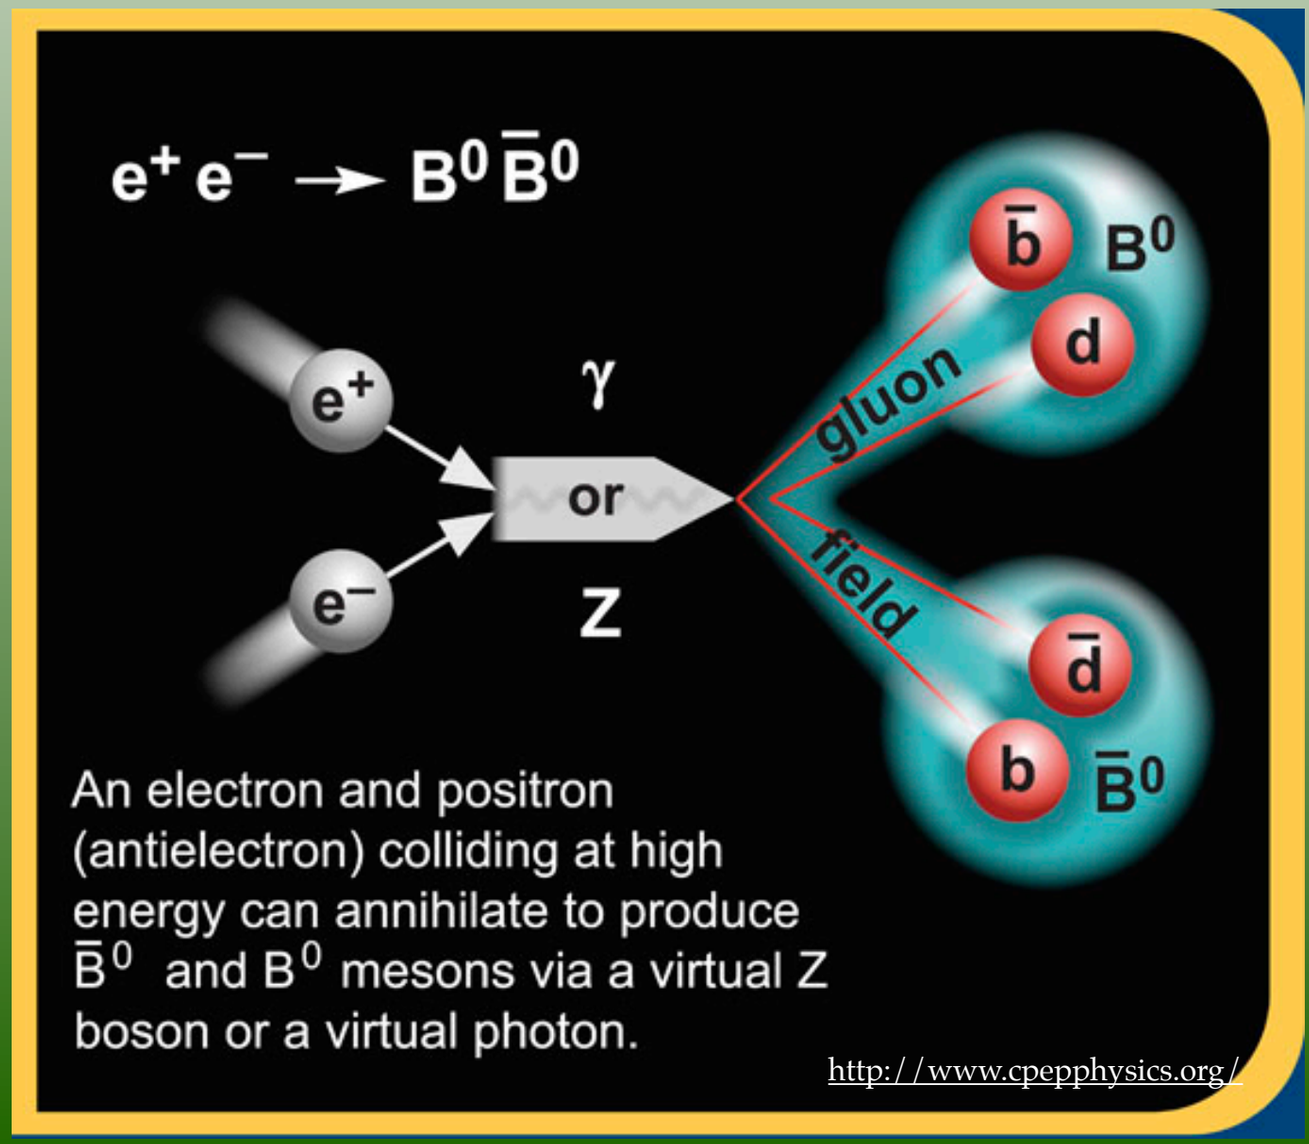
"What holds it together?"



Neutrinos!

Antimatter is Real!

- Every particle type has an antiparticle
- Antiparticles are denoted by
  - ★Bar over the particle symbol (e.g. d and $\bar{d}$ or ν_e and $\bar{\nu}_e$)
  - ★The opposite charge sign (e^+ or e^-)
- Matter and Antimatter particles annihilate and produce new particles and radiation



Scales and Units

The scales involved in particle physics are well outside of our everyday experiences.
Welcome to the world of the very small...

The Speed of Light $c = 299,792,458 \frac{\mathrm{m}}{\mathrm{s}} = 670,616,629$ mph

Energy

An electron volt (eV) is the amount of energy required to move an electron across a 1 volt potential.

$1 \text{ eV} = 4.4 \times 10^{-20}$ kW·hr

Mass

Mass and energy are related by Einstein's $E=mc^2$, which means $m = E/c^2$.

$$1 \text{ eV}/c^2 = 1.782 \times 10^{-33} \text{g}$$

The mass of a grain of sand is about 2×10^{27} eV/c^2

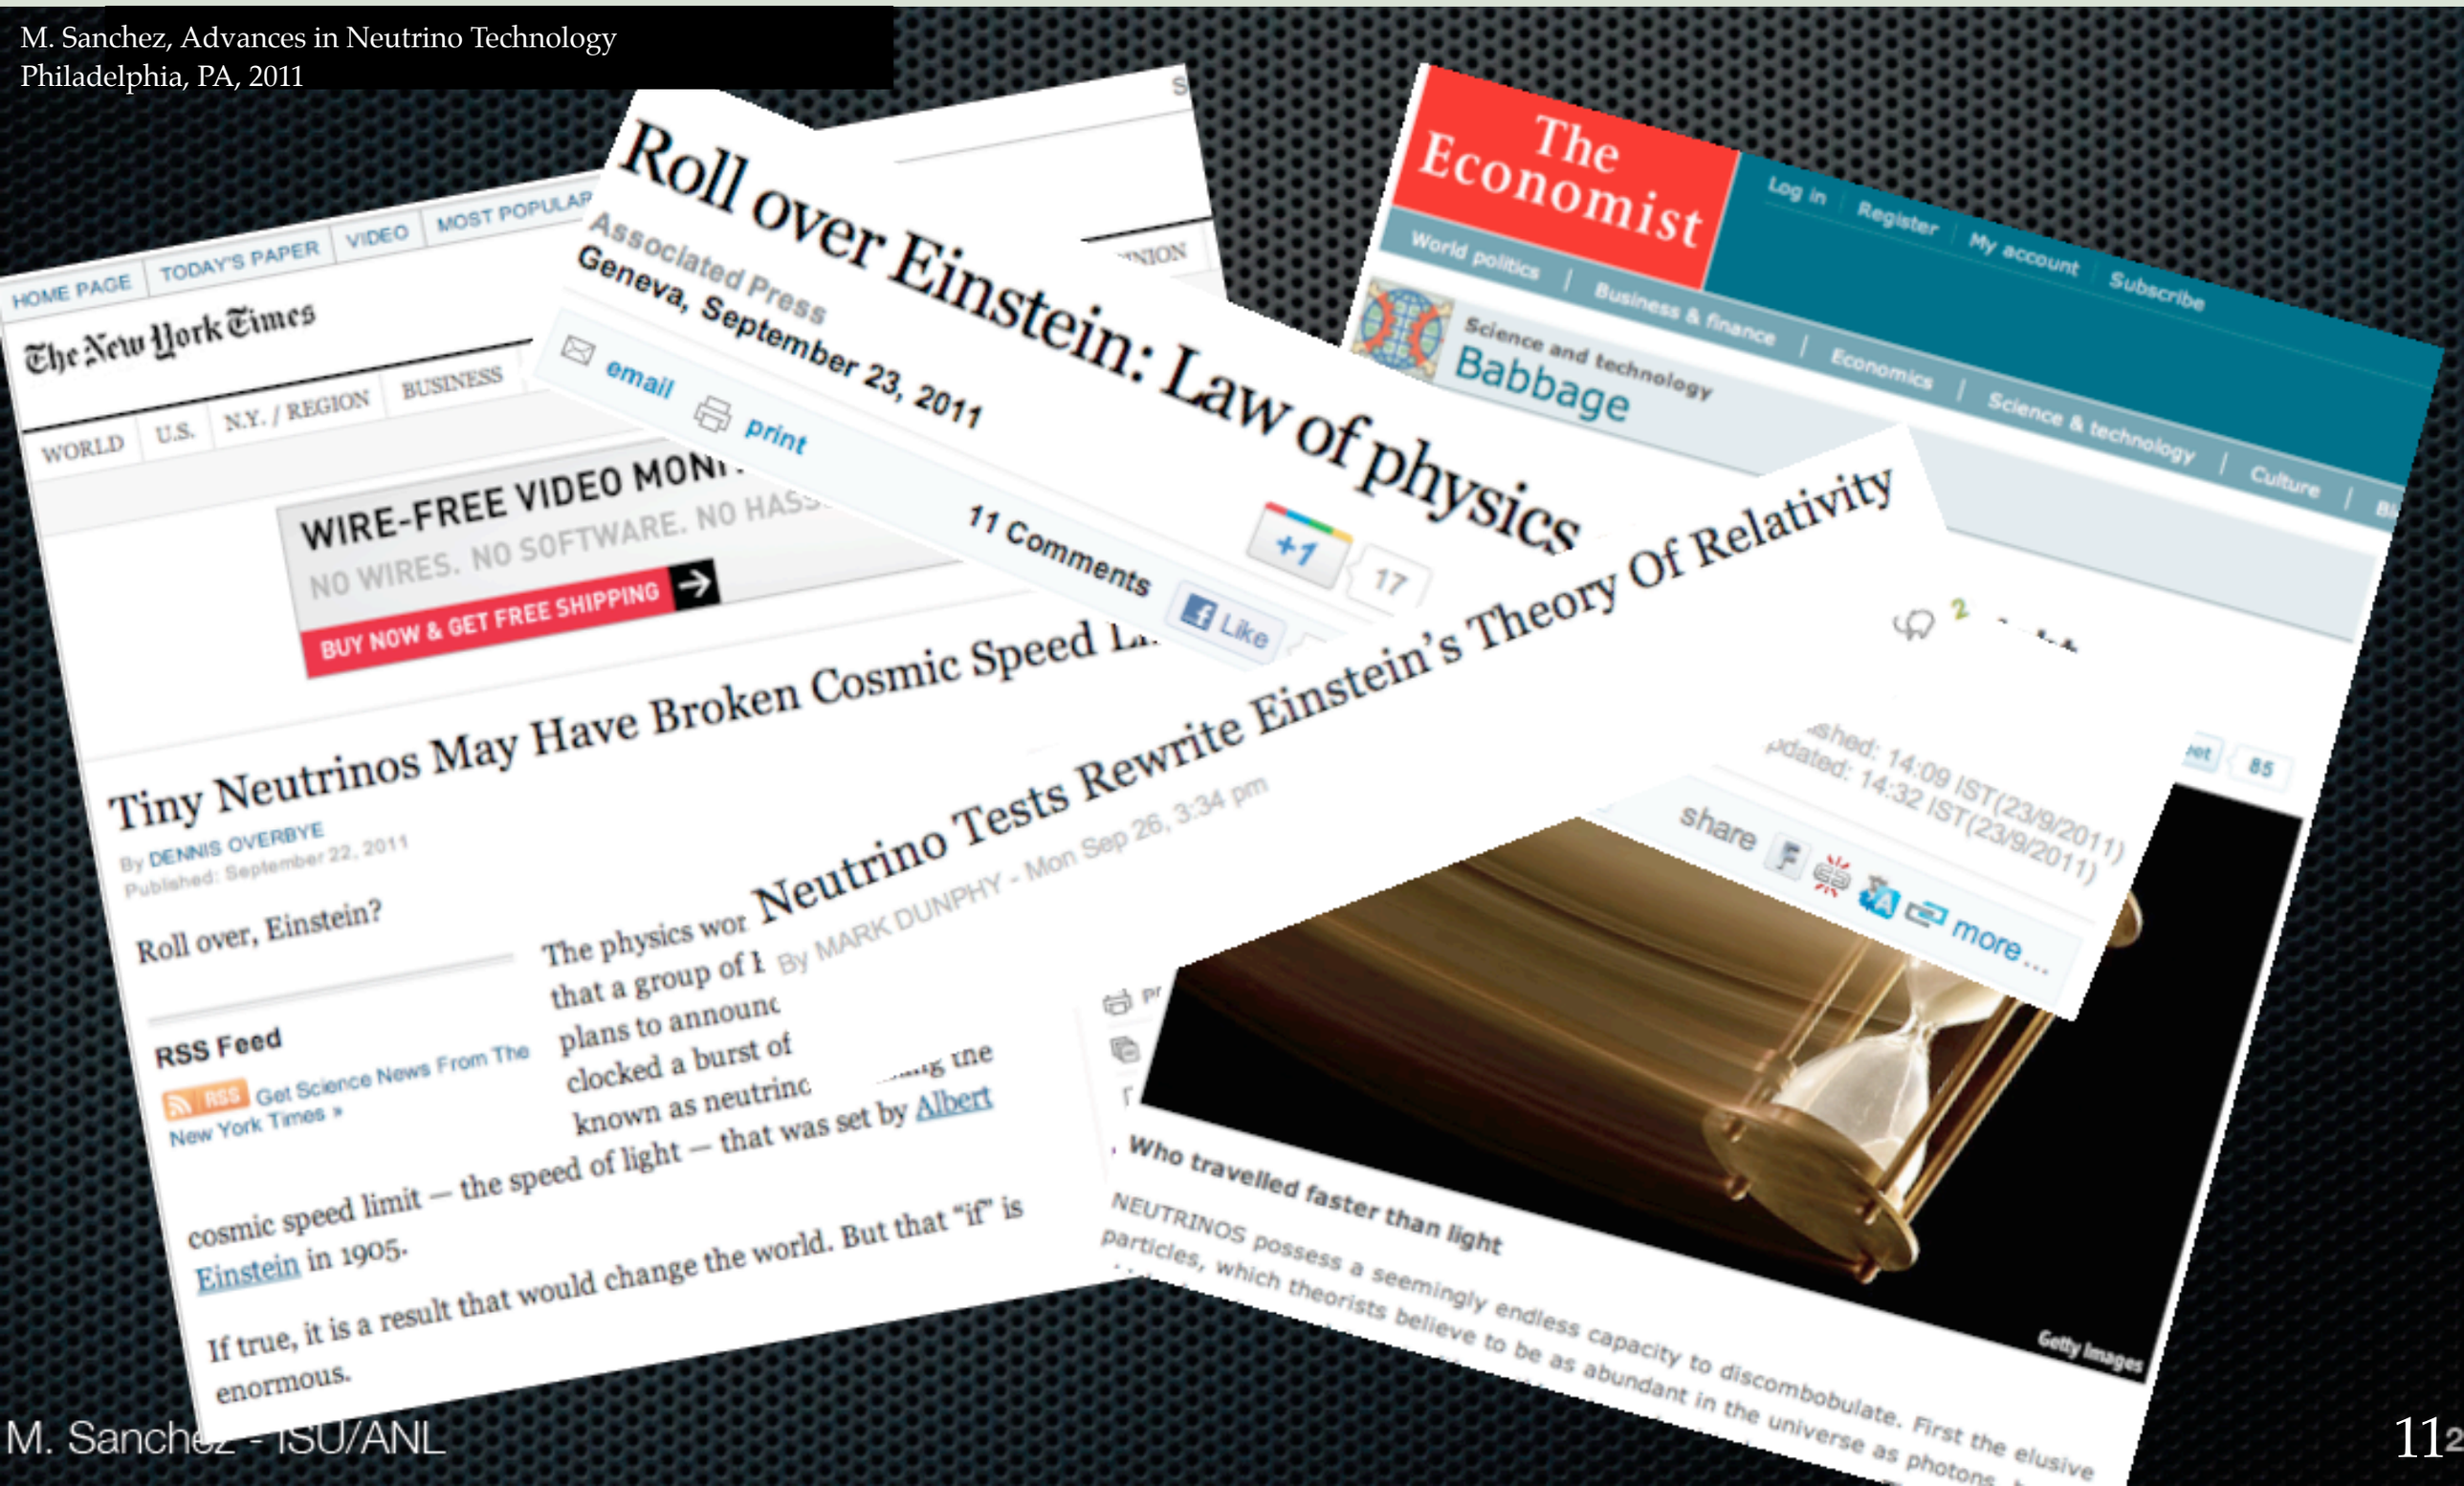
Electron Mass $= 510,999$ eV/c^2

Neutrinos ... Could What?

- ✳Explain the "missing" momentum of beta decay!
- ✳Be very hard (but not impossible) to detect!
- ✳Come in three flavors!
- ✳Seem to change flavors as they travel!
- ✳Have very very little, but not zero mass!
  - ★Usually travel very very close to (but slower than) *c*
- ✳Tell us about the foundational laws of the Universe!
- ✳Explain why we exist!
- ✳Have many more surprises in store!

Is there any evidence they travel faster than light?

M. Sanchez, Advances in Neutrino Technology
Philadelphia, PA, 2011

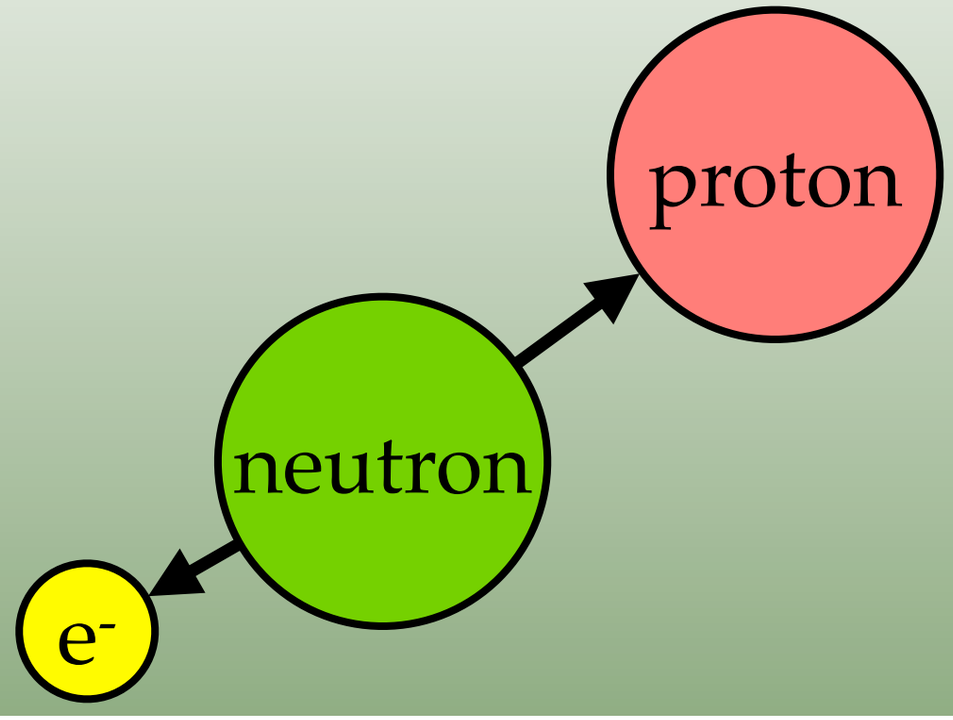


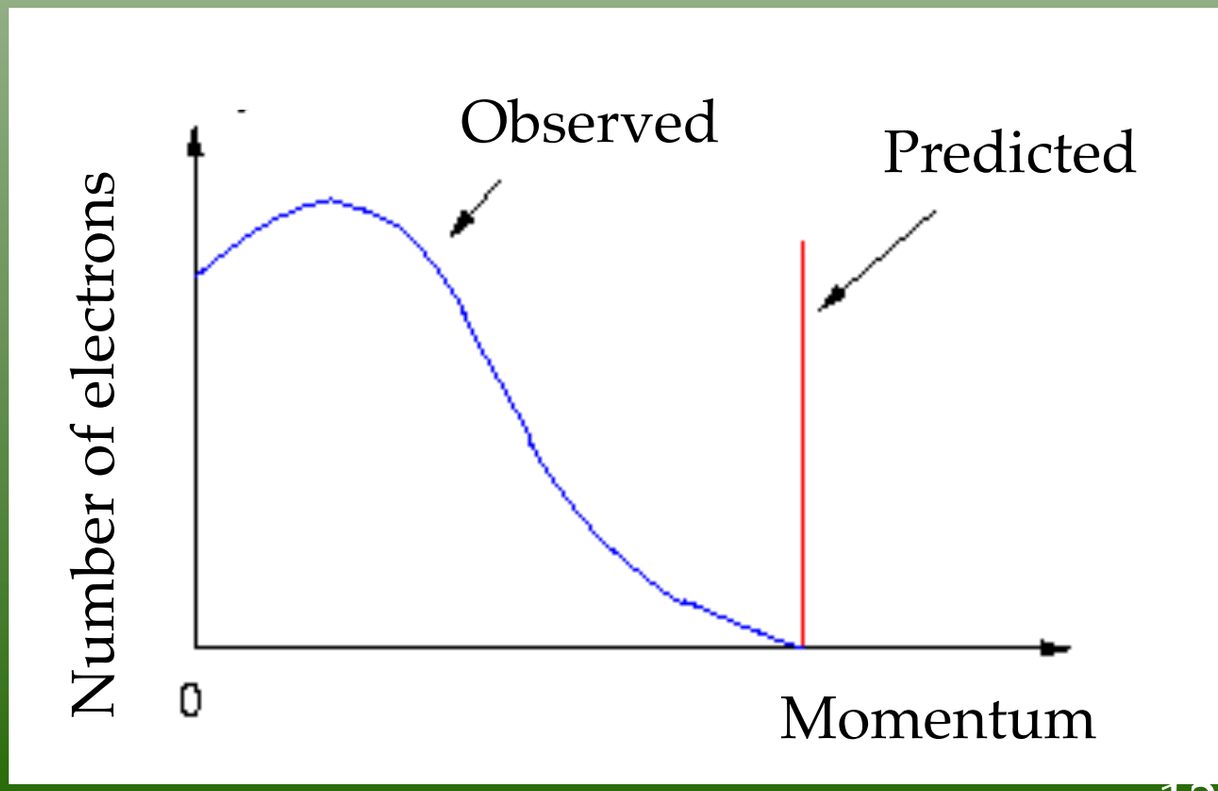
Is there any evidence they t… than light?

M. Sanchez, Advances in Neutrino Technology
Philadelphia, PA, 2011

The Mystery of the Missing Momentum...

- The scientific method in action.
- Question: *Does conservation of energy apply at the subatomic level?*
- Hypothesis: *Yes, it does.*
- Prediction: *We can calculate the momenta of the decay daughters of a free neutron exactly.*
- Test: *Measure the momenta.*





A New Hypothesis...

Dear Radioactive Ladies and Gentlemen,

Physikalisches Institut
der Eidg. Technischen Hochschule
Zürich

Zürich, 4. Dez. 1930
Gloriastrasse

Liebe Radioaktive Damen und Herren,

Wie der Ueberbringer dieser Zeilen, den ich huldvollst anzuhören bitte, Ihnen des näheren auseinandersetzen wird, bin ich angesichts der "falschen" Statistik der N- und Li-6 Kerne, sowie des kontinuierlichen beta-Spektrums auf einen verzweifelten Ausweg verfallen um den "Wechselsatz" (1) der Statistik und den Energiesatz zu retten. Nämlich die Möglichkeit, es könnten elektrisch neutrale Teilchen, die ich Neutronen nennen will, in den Kernen existieren, welche den Spin 1/2 haben und das Ausschliessungsprinzip befolgen und sich von Lichtquanten ausserdem noch dadurch unterscheiden, dass sie nicht mit Lichtgeschwindigkeit laufen. Die Masse der Neutronen müsste von derselben Grössenordnung wie die Elektronenmasse sein und jedenfalls nicht grösser als 0,01 Protonenmasse.- Das kontinuierliche beta- Spektrum wäre dann verständlich unter der Annahme, dass beim beta-Zerfall mit dem Elektron jeweils noch ein Neutron emittiert wird, derart, dass die Summe der Energien von Neutron und Elektron konstant ist.

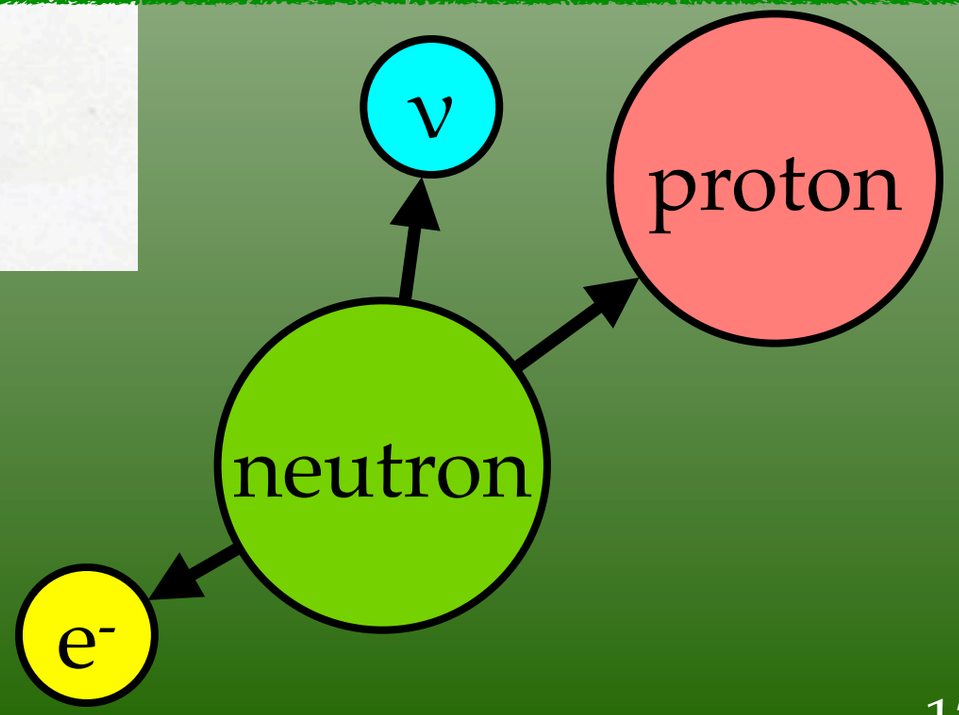
✳Must be

★Electrically neutral

★Weakly interacting

★Very light

✳Dec. 4, 1930: Wolfgang Pauli proposed a new particle



How Weak?

- They can pass through a *light year* of lead and not hit anything!
- About 50 trillion of them are passing though you ever second of every day from the sun, and you don't notice!
- How do we find something so ghostly?

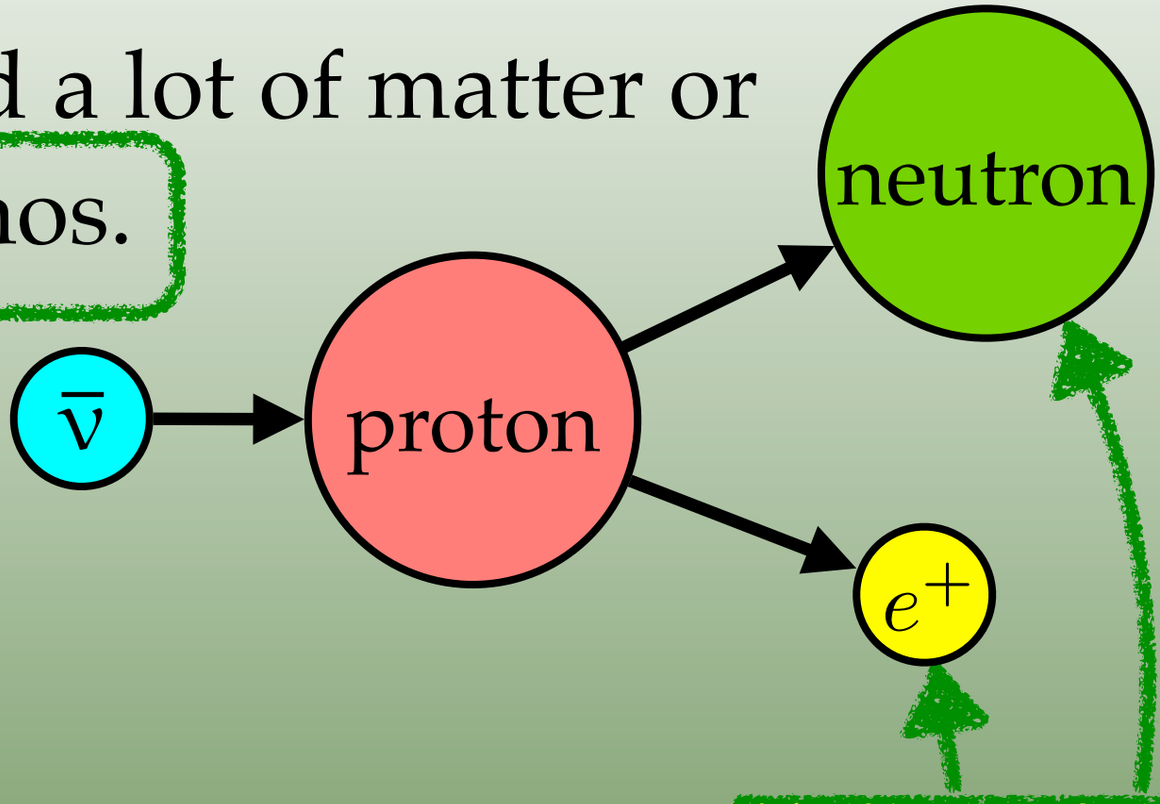
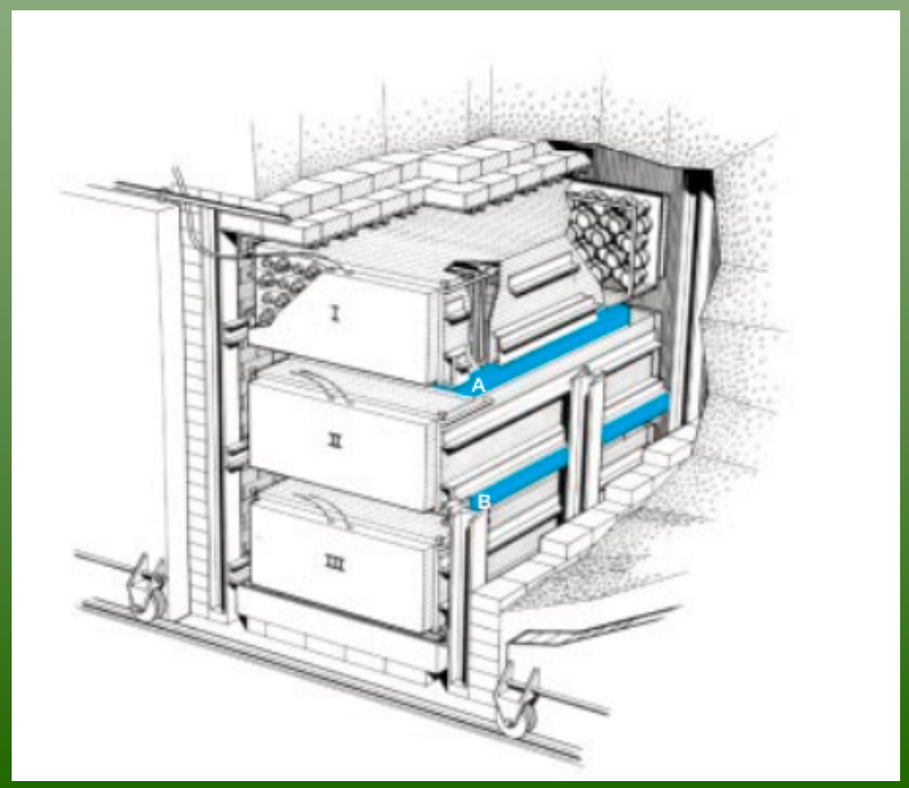
Two Guys and a Nuclear Reactor

✶We either need a lot of matter or a lot of neutrinos.



Fred Reines

Lots of antineutrinos produced by the Savannah River nuclear reactor



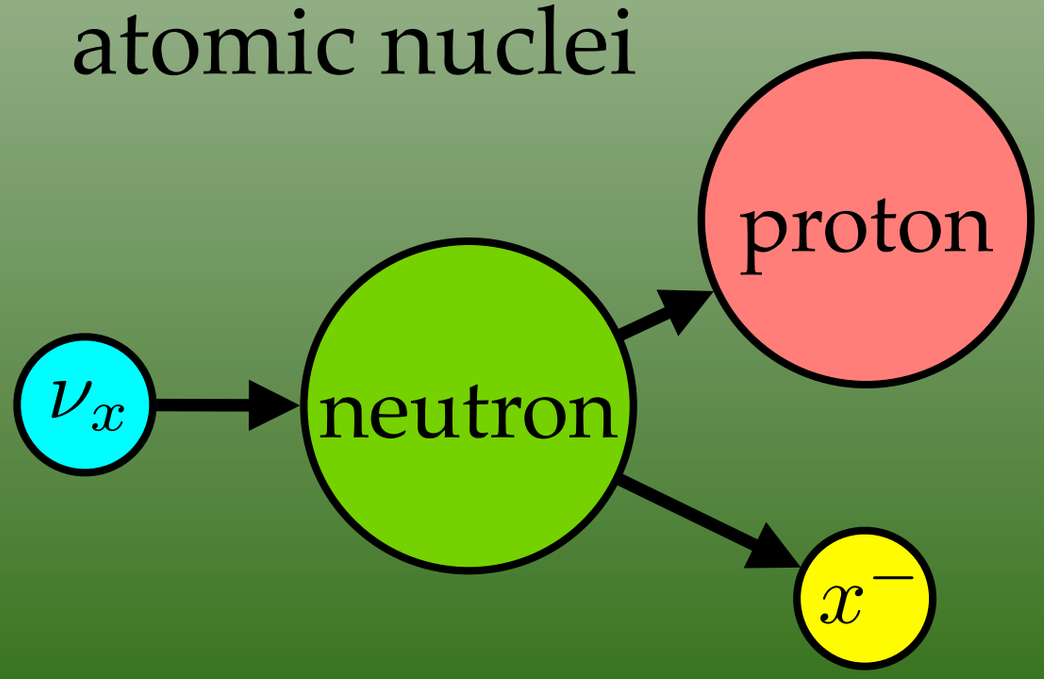
1956: Their experiment detected the products of the neutrino interactions.

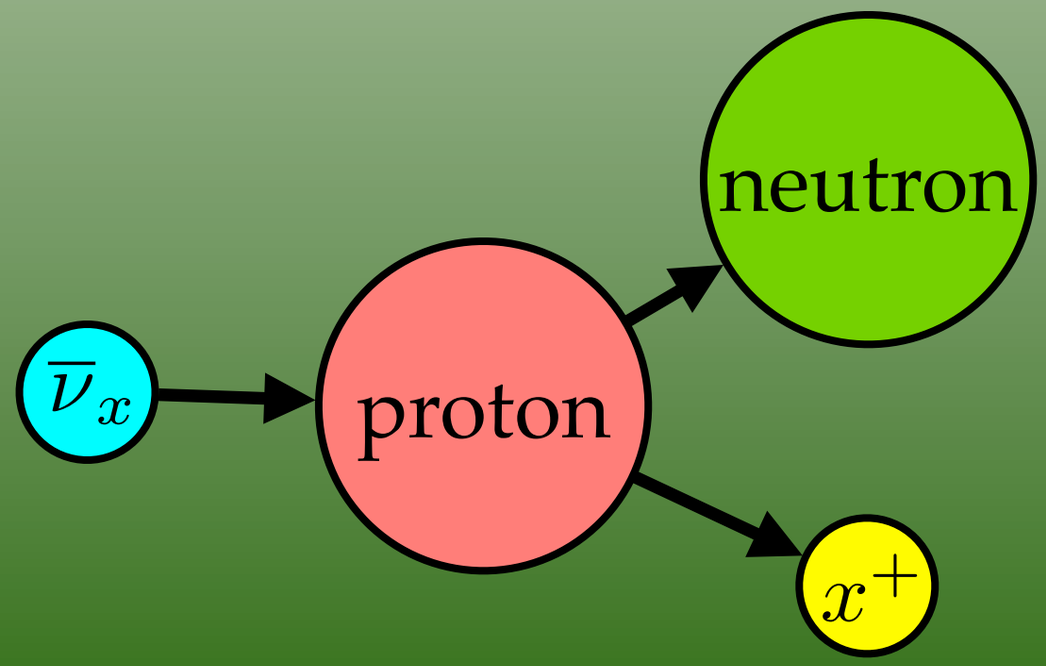
Clyde Cowan, Jr.

Flavors of a very different kind

✳Pauli proposed one neutrino, but we have found 3

✳Identified by the results of their collisions with atomic nuclei

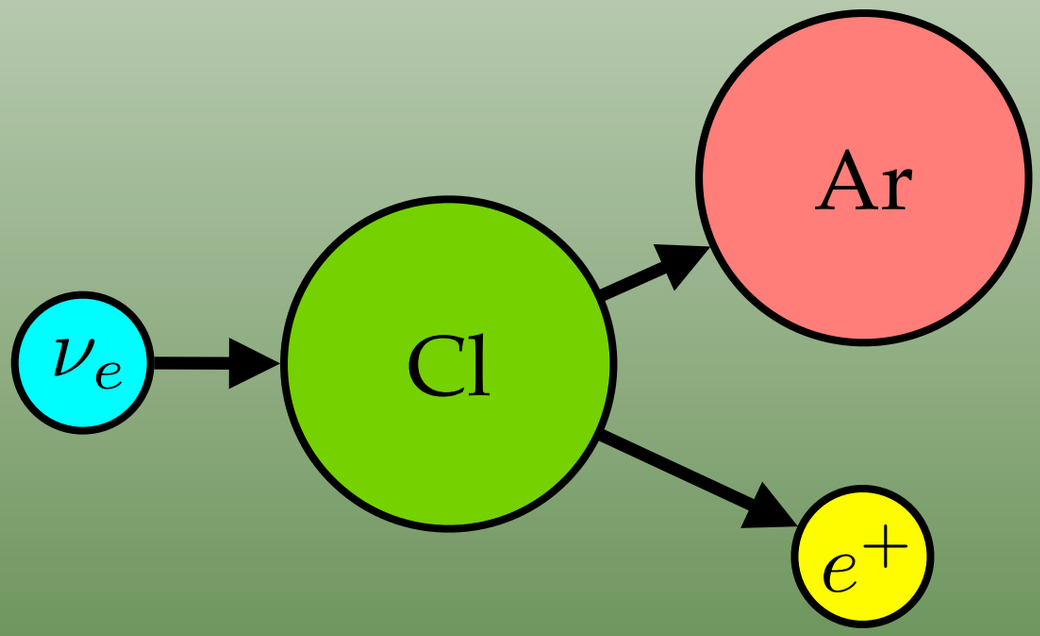


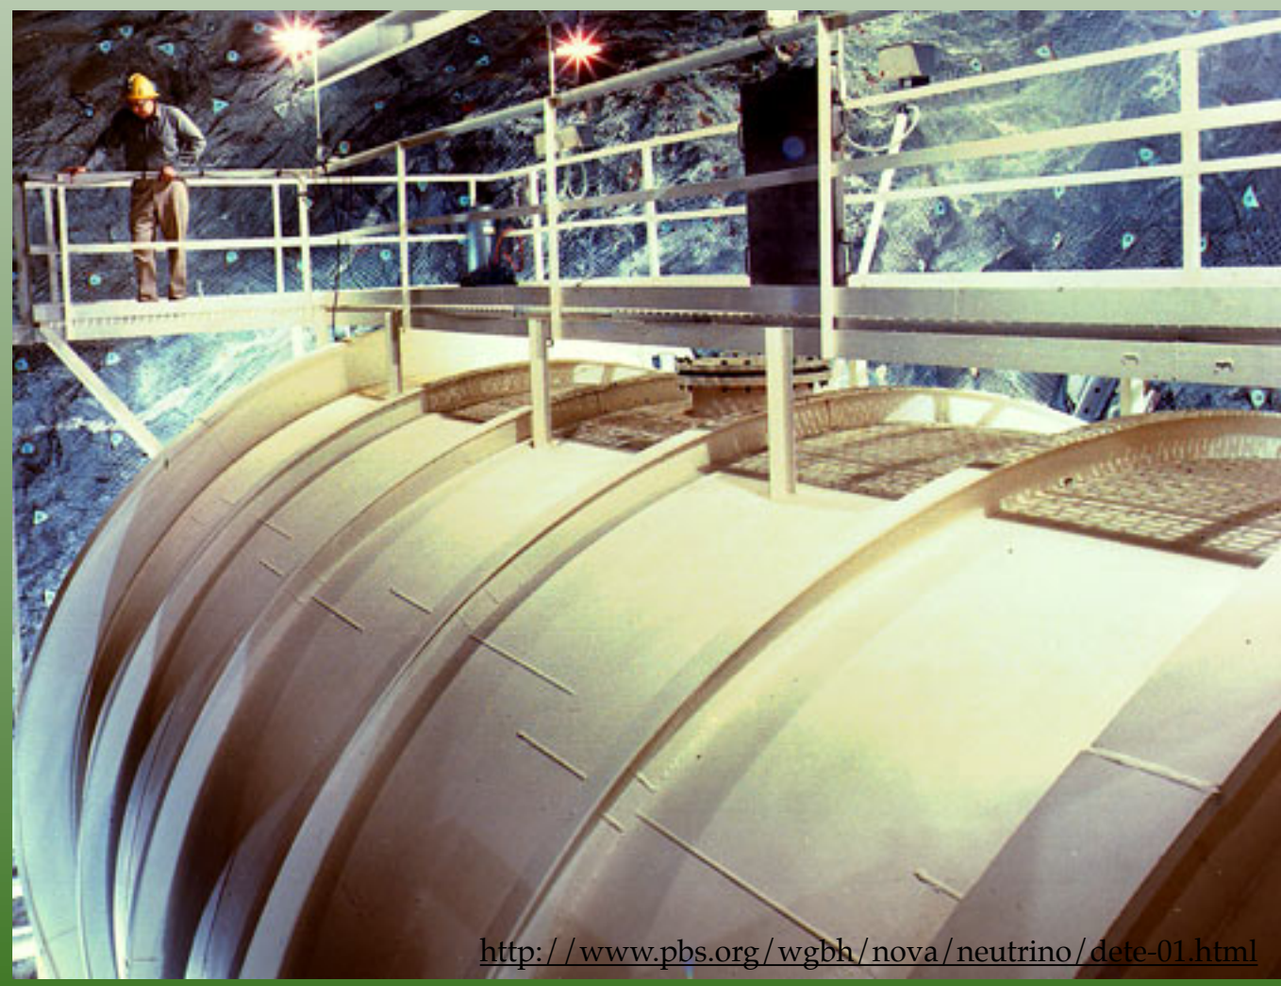


Enter: Raymond Davis

Image Credit: Brookhaven National Lab.

- Beginning in 1968, he used dry cleaning fluid (containing Chlorine) to detect neutrinos from the sun





http://www.pbs.org/wgbh/nova/neutrino/dete-01.html

Found only 1/3 of the expected number of neutrinos!

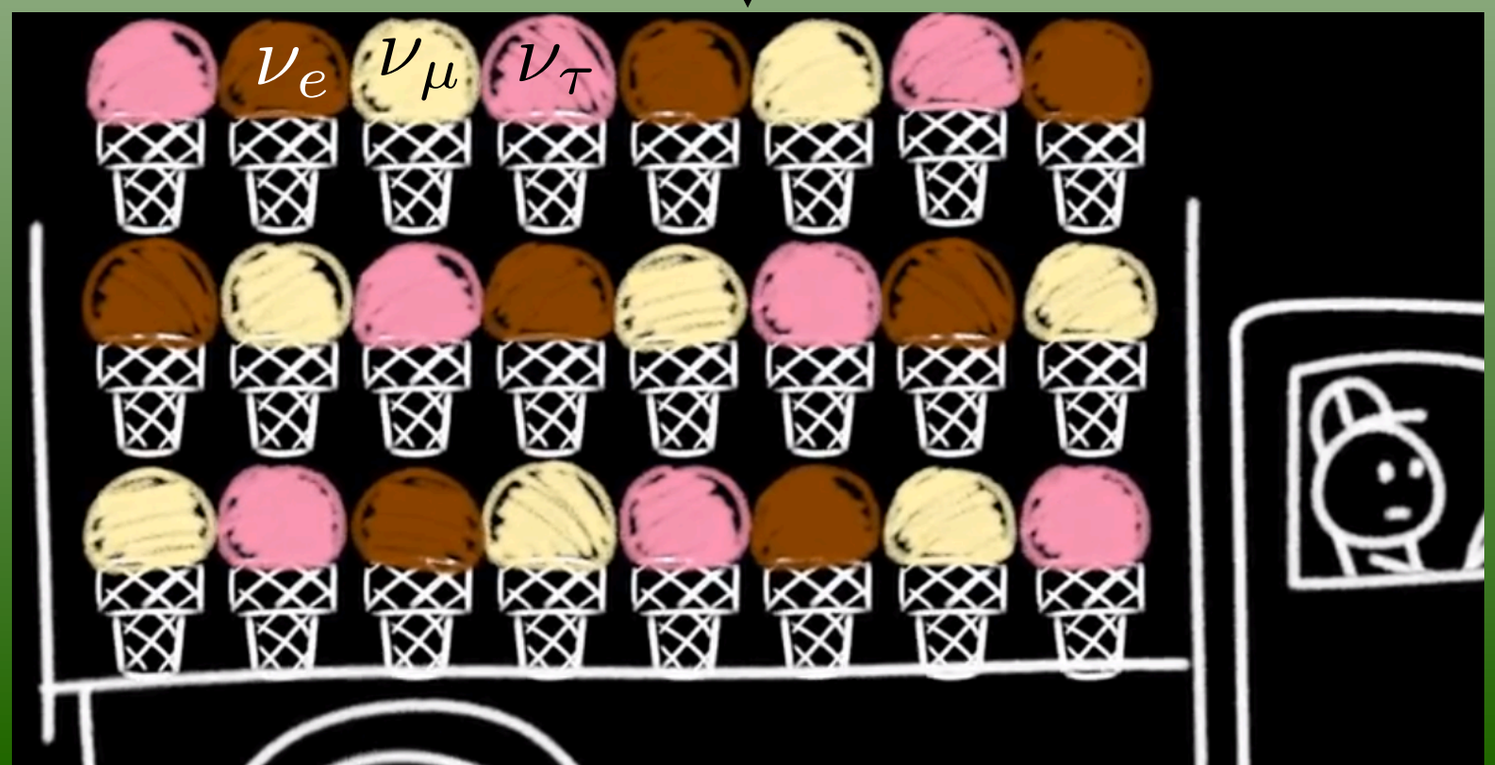
They *What?!*

ν_e Source
(The Sun)

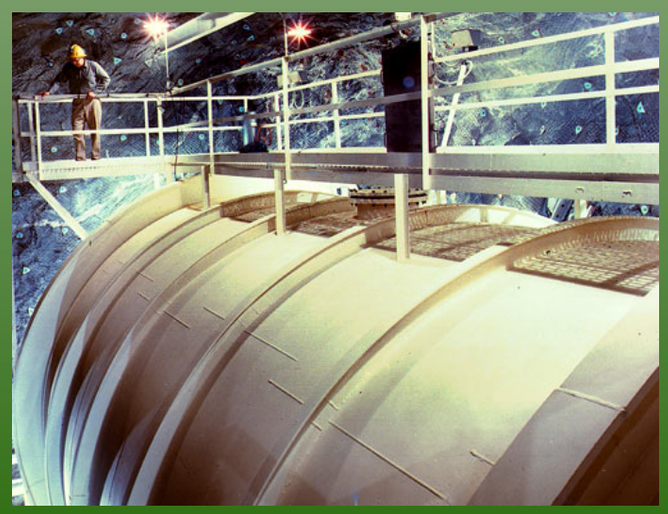
Now my own suspicion is that the Universe is not only queerer than we suppose, but queerer than we *can* suppose." - J. B. S. Haldane

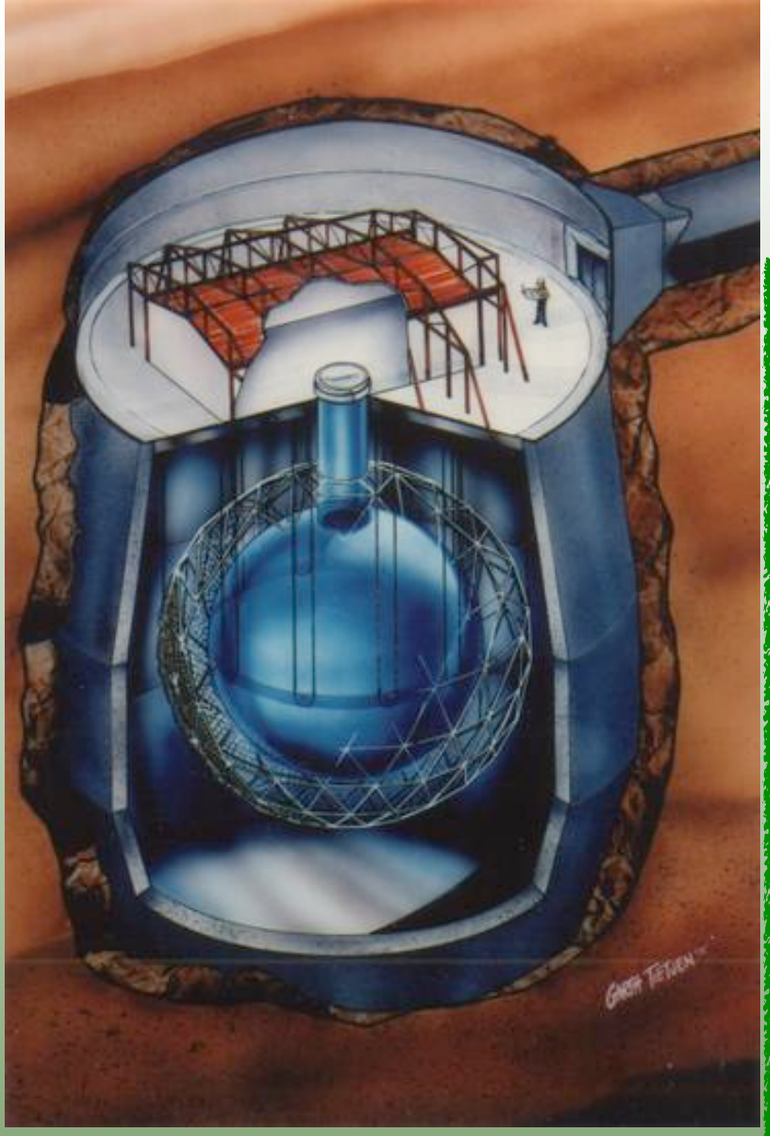
Ice cream analogy taken from *The MINOS Experiment: Mining the Imagination* (June, 2002)
Graphics taken from *Fermilab: Science at Work*

They *What?!*



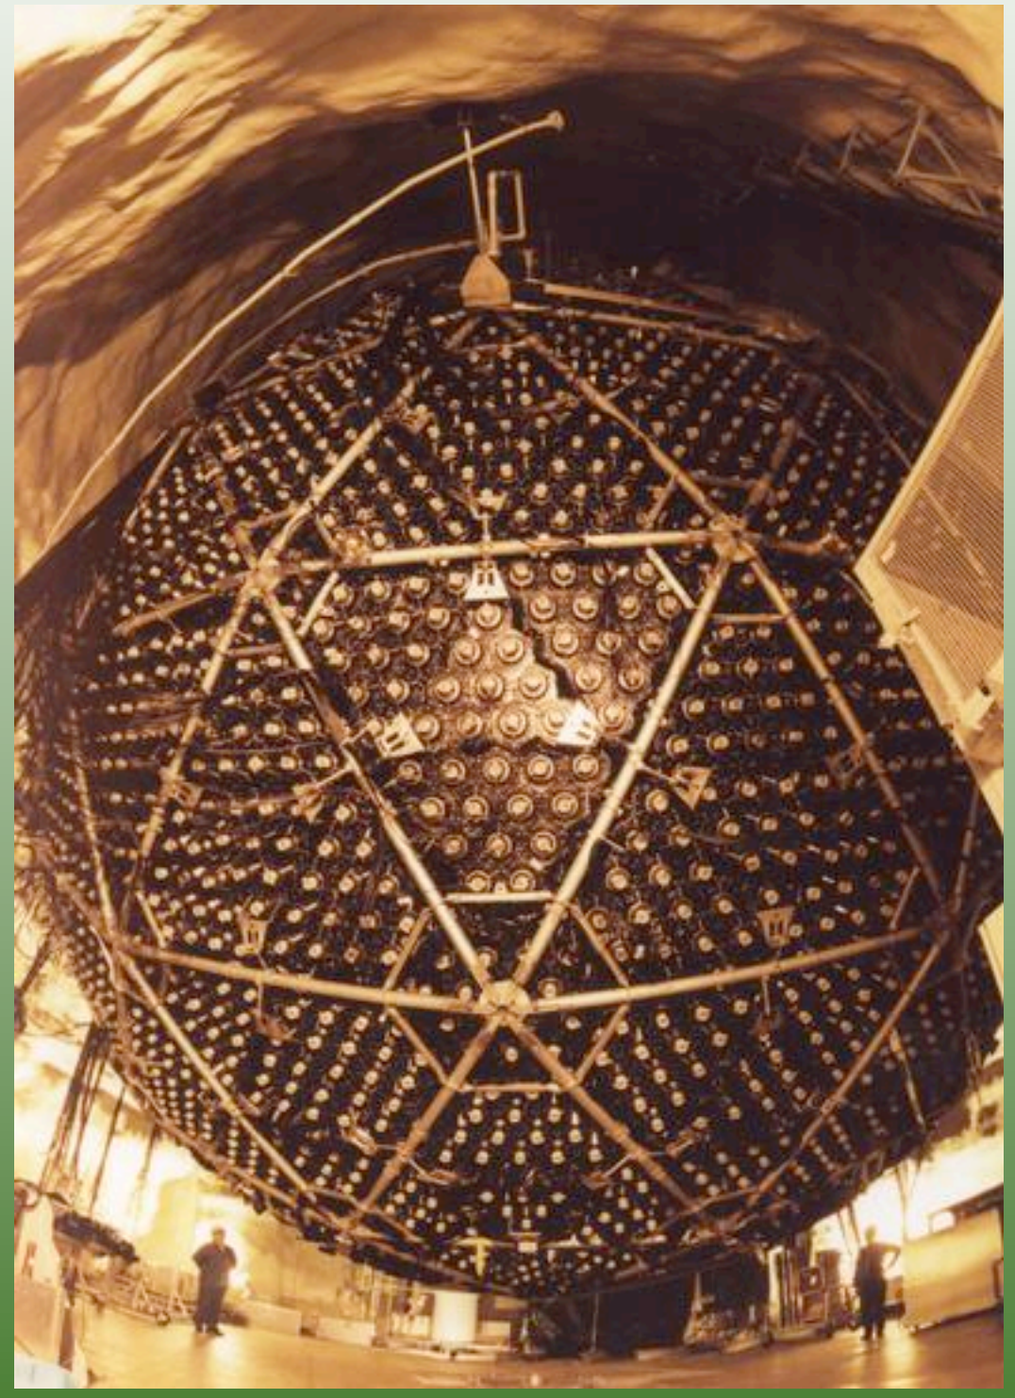
ν_e Source
(The Sun)





Confirmation...

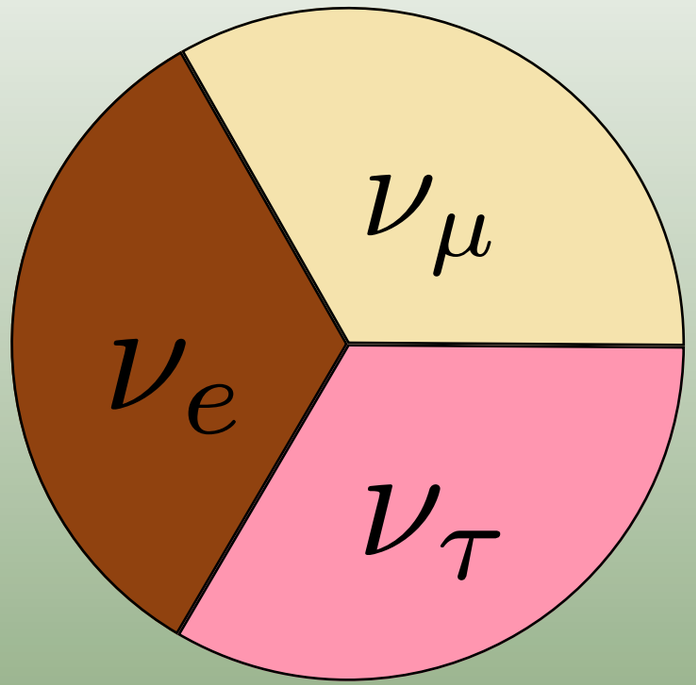
The Sudbury Neutrino Observatory in Canada used heavy water to detect all *three* kinds of neutrinos from the sun.



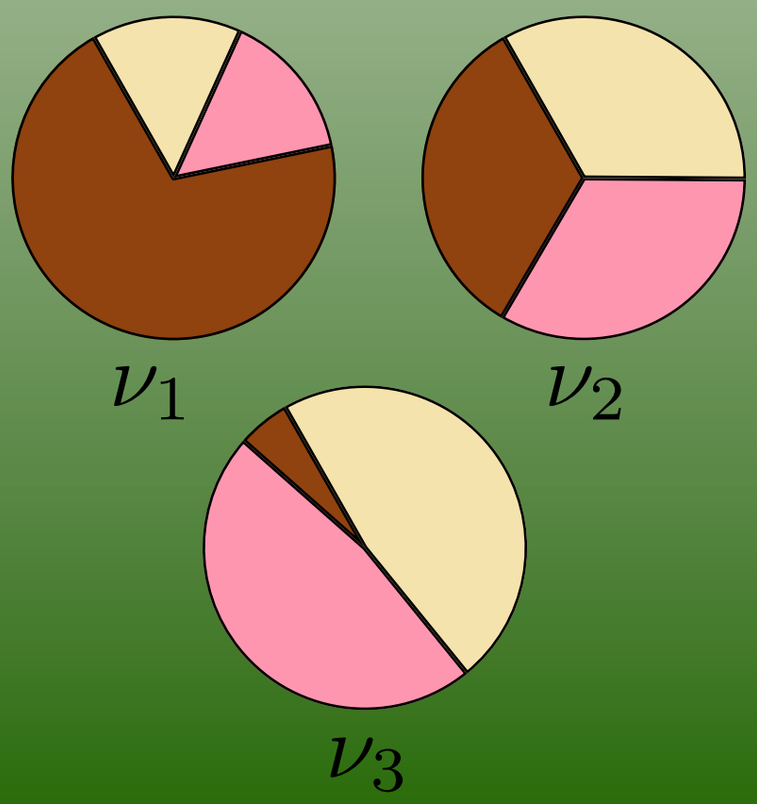
Images from SNO Image Catalog

- In 2001, SNO confirmed that the solar neutrino problem was the result of neutrinos *oscillating* between flavors

Lets Look From Another Angle



Each scoop is actually a combination of all three flavors. When seen from the side, only one is visible. As they travel, they rotate at a rate determined by the speed of the truck.

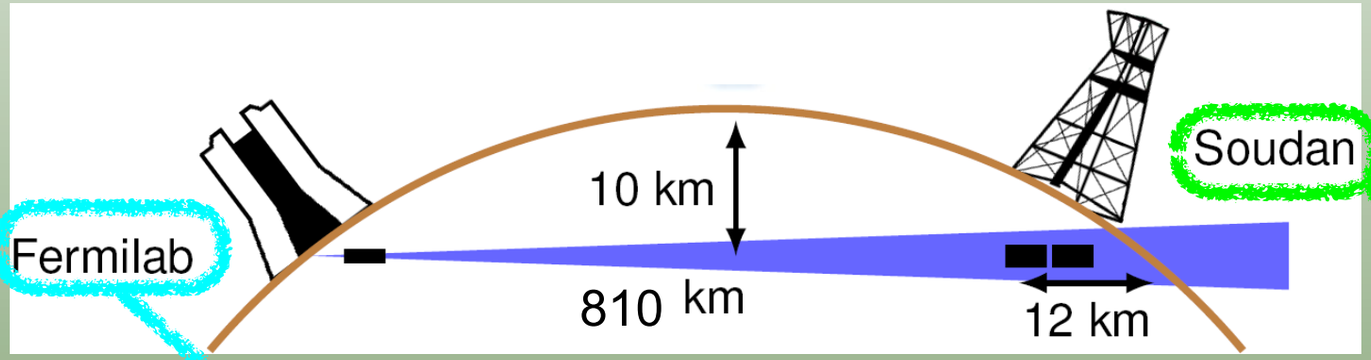


What propagates through space is a particle of definite mass that is a combination of the three flavors. There are three of these particles, each with a different recipe using using those flavors

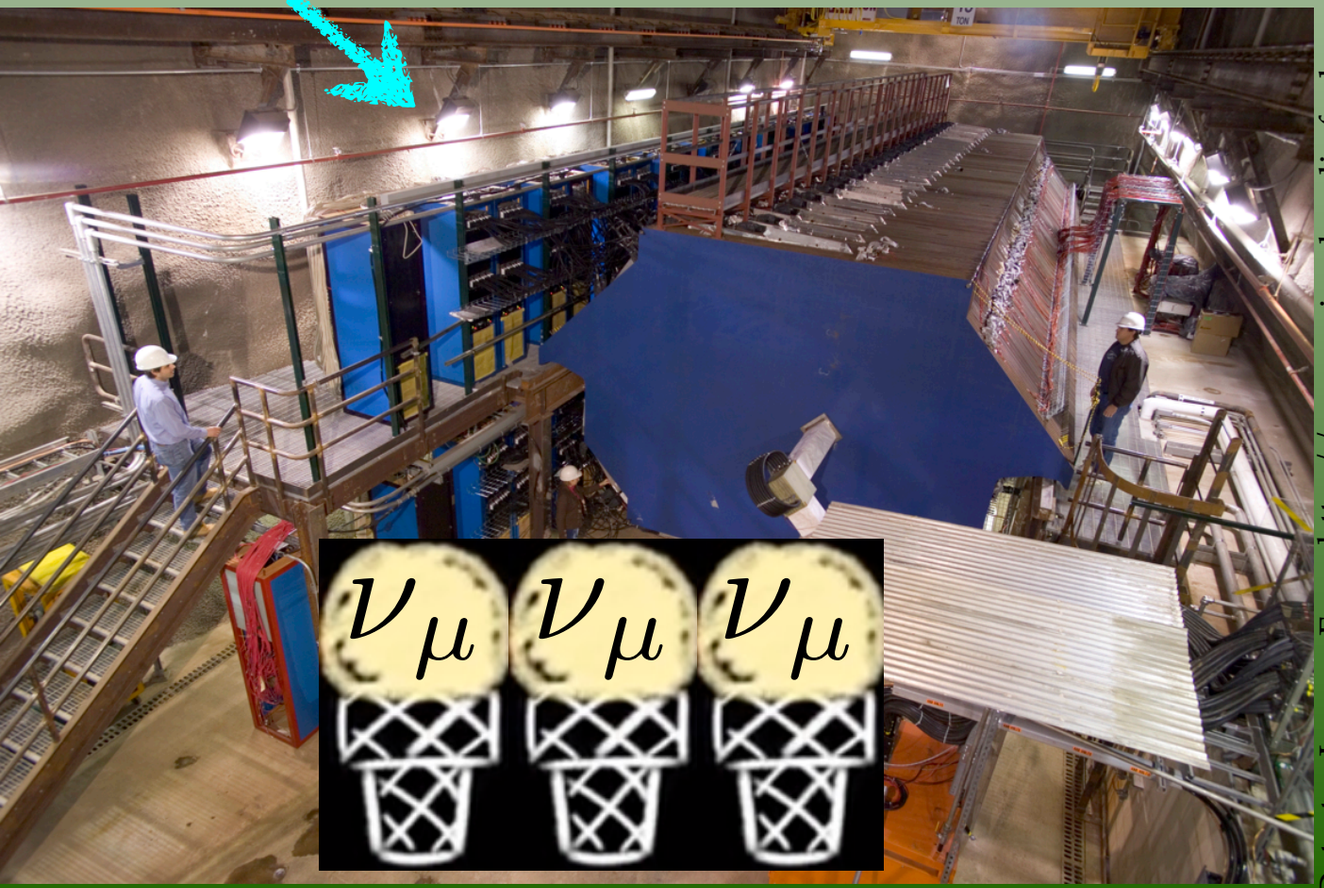
Right Through the Earth...

✳We can also make our own neutrinos

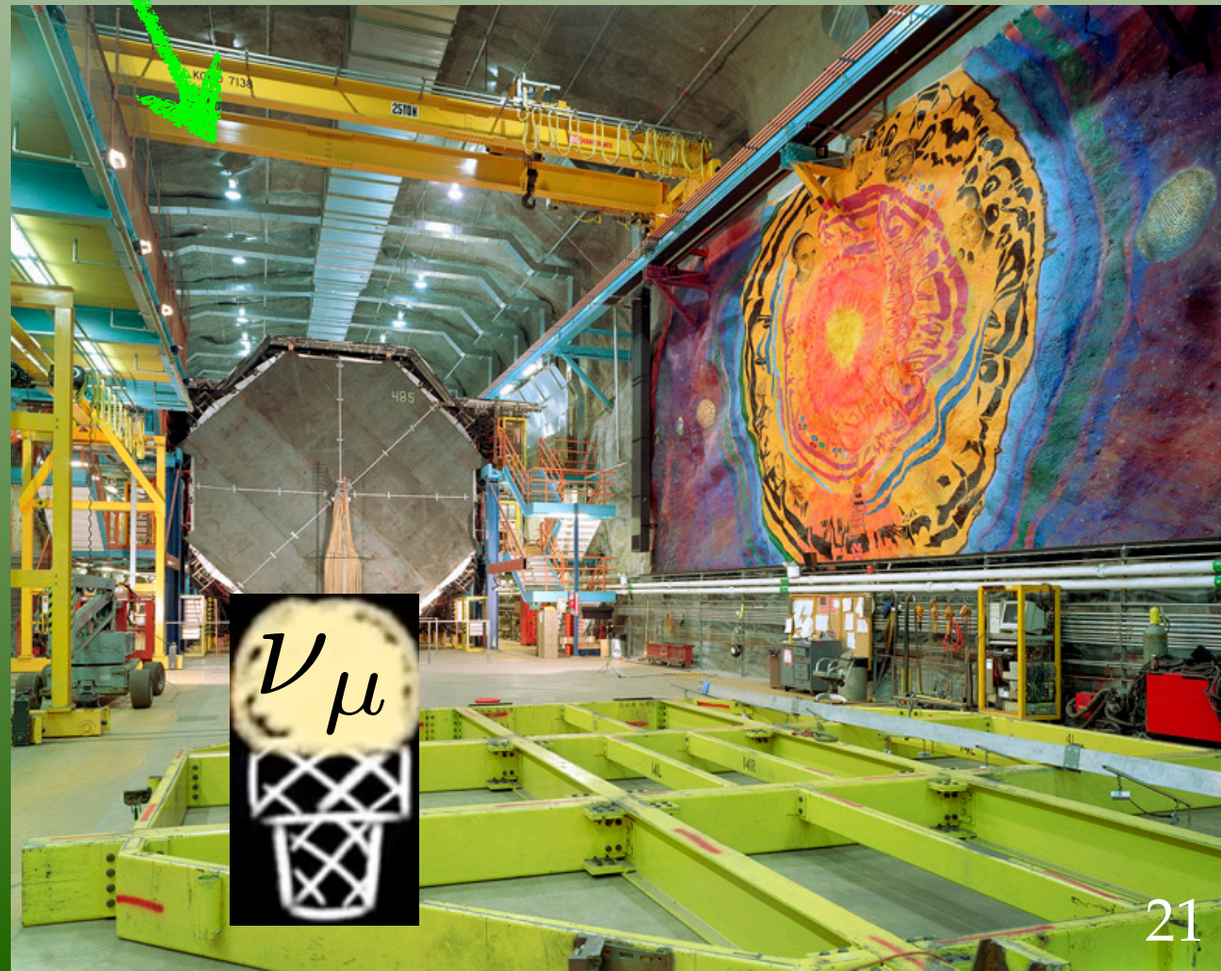
Image Courtesy Michelle M. de Medeiros, Universidade Federal de Goias Brasil



The MINOS detectors can only see ν_μ



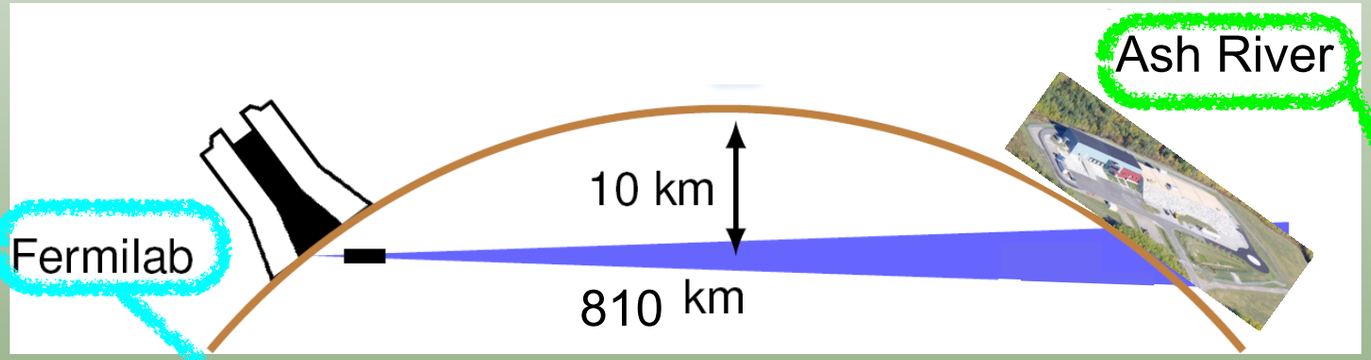
Detector Images From http://www-visualmedia.fnal.gov/

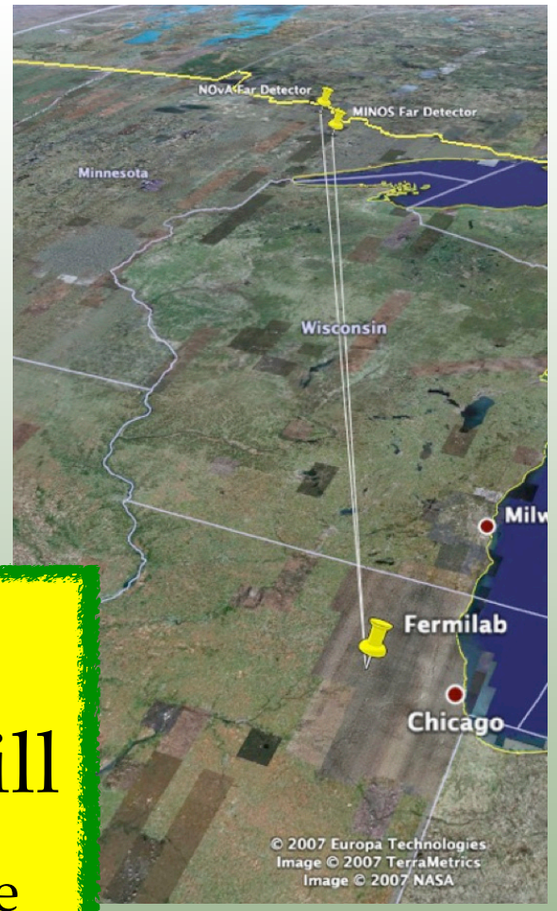


Right Through the Earth...

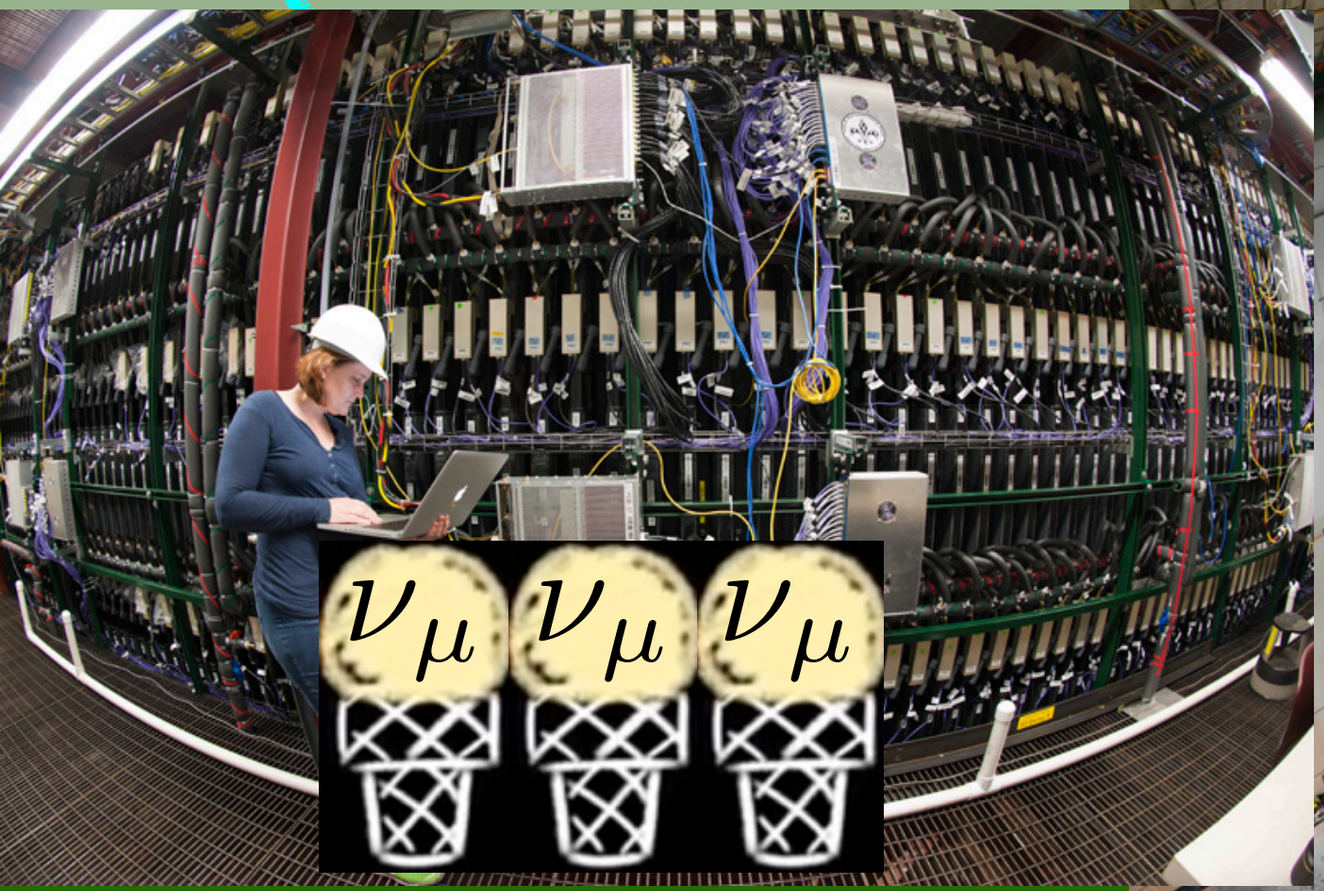
✳We can also make our own neutrinos

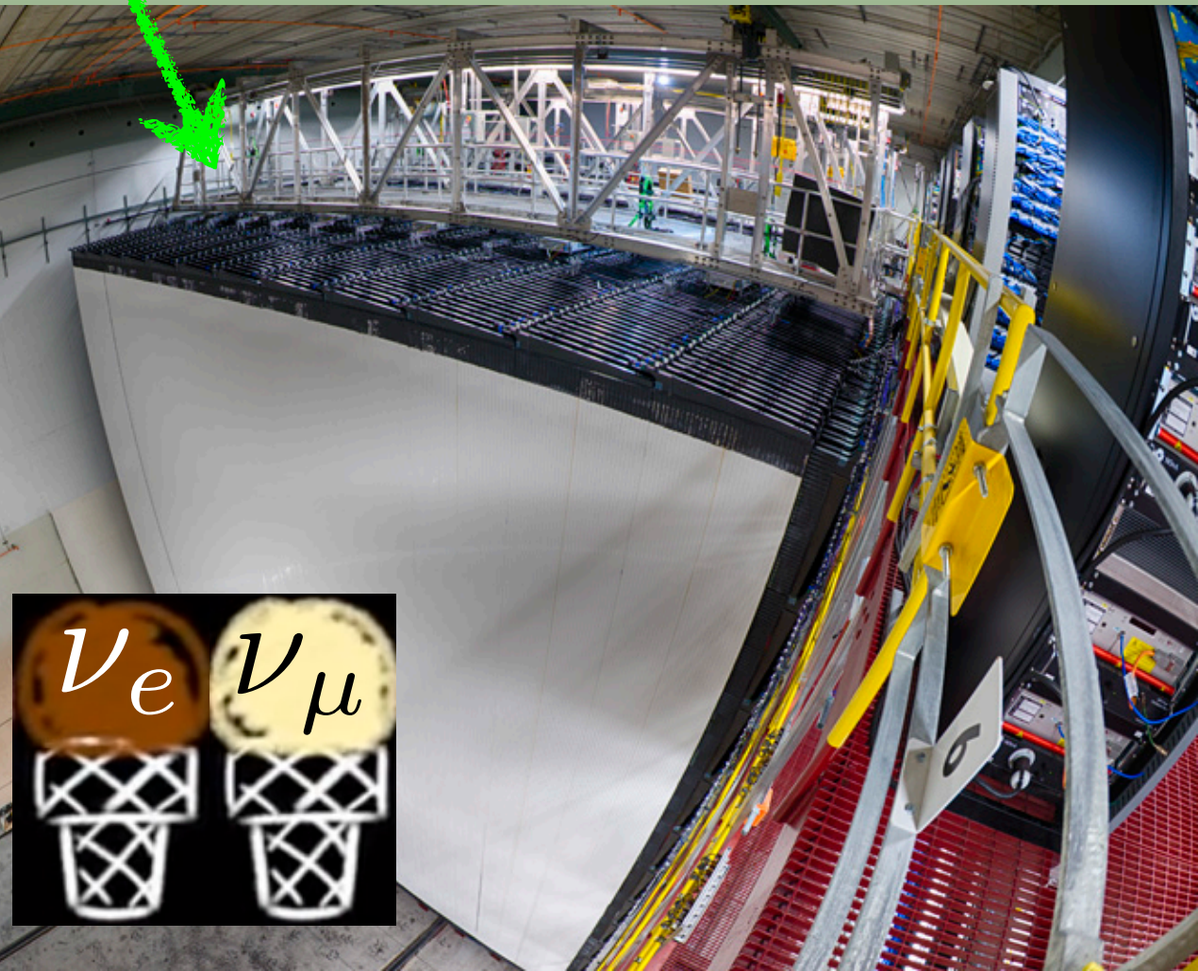
Image Courtesy Michelle M. de Medeiros, Universidade Federal de Goias Brasil





The NOvA detectors will see ν_μ *and* ν_e





Faster than light?

GPS technology enables measurement of distance with sufficient precision.

The OPERA Experiment

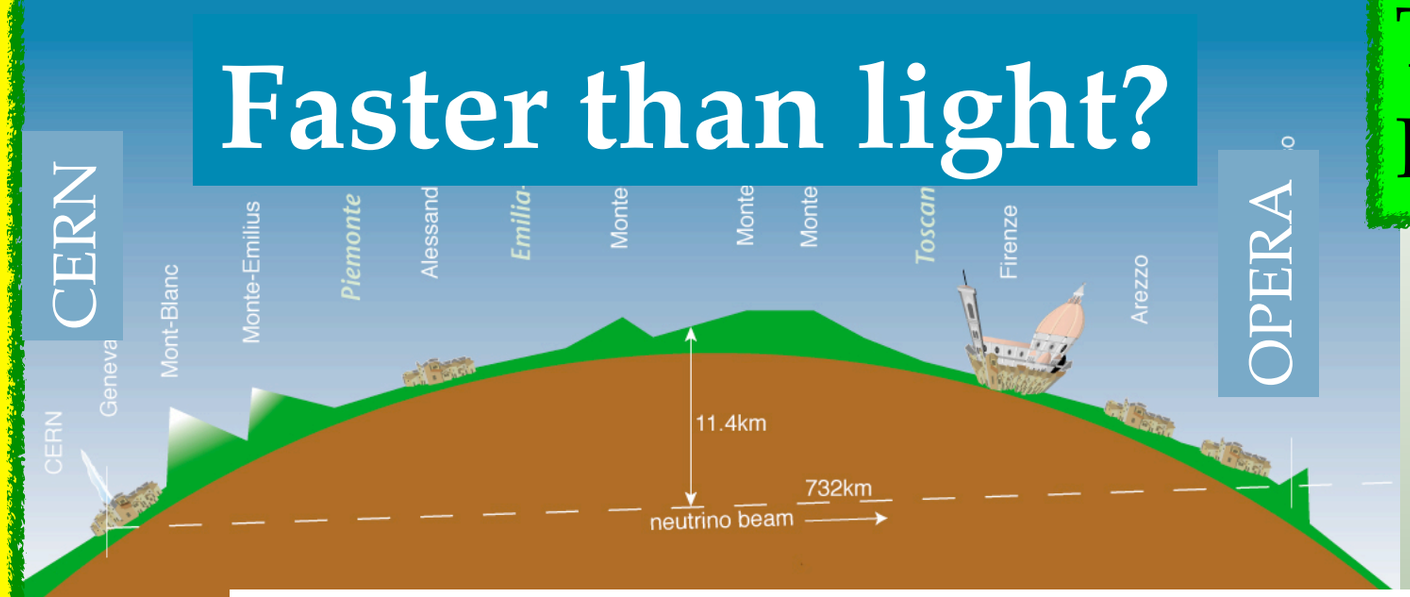


Image: CERN CNGS

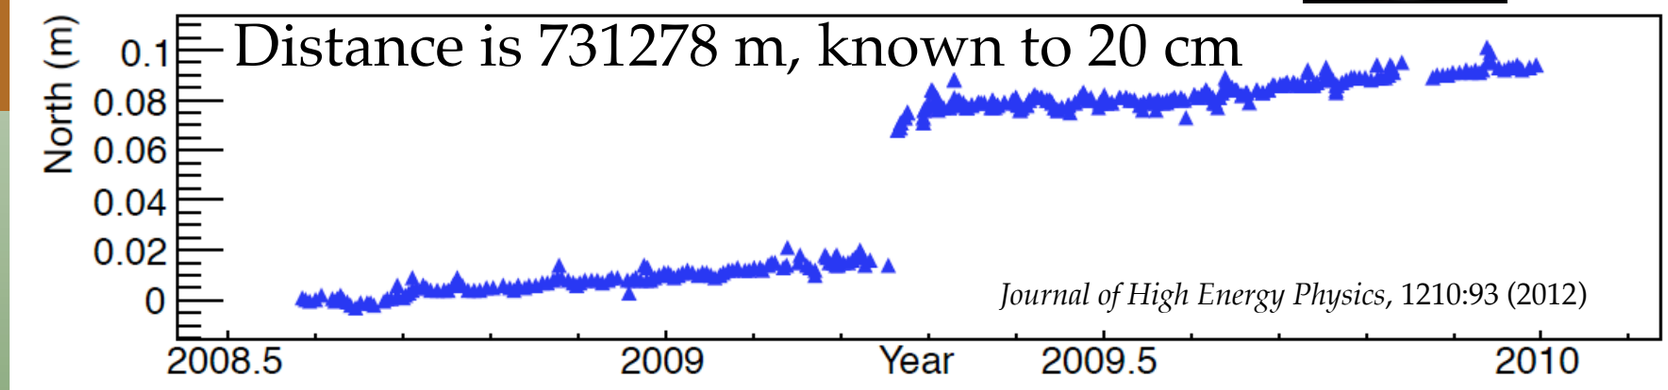


$$\text{Speed} = \frac{\text{Distance}}{\text{Time}}$$

Neutrino seemed to arrive 60 ns (6×10^{-8} s) early!

M. Dracos, The XXV International Conference on Neutrino Physics and Astrophysics, Kyoto, Japan, June 8, 2012

- Two identified issues:
  - Faulty connection of the optical fibre to the Master Clock artificially increasing the neutrino anticipation by ~74 ns.
  - Internal Master Clock frequency off by $\Delta f/f = 1.24\times10^{-7}$ (124 ns/s) artificially decreasing the neutrino anticipation by ~15 ns
    (DAQ time bin 10 ns→9.99999877 ns).

Connected to the Universe

✳The Universe is governed by four interactions

Strong Nuclear

Electromagnetic

Weak Nuclear

Gravity

Neutrinos do not feel these interactions

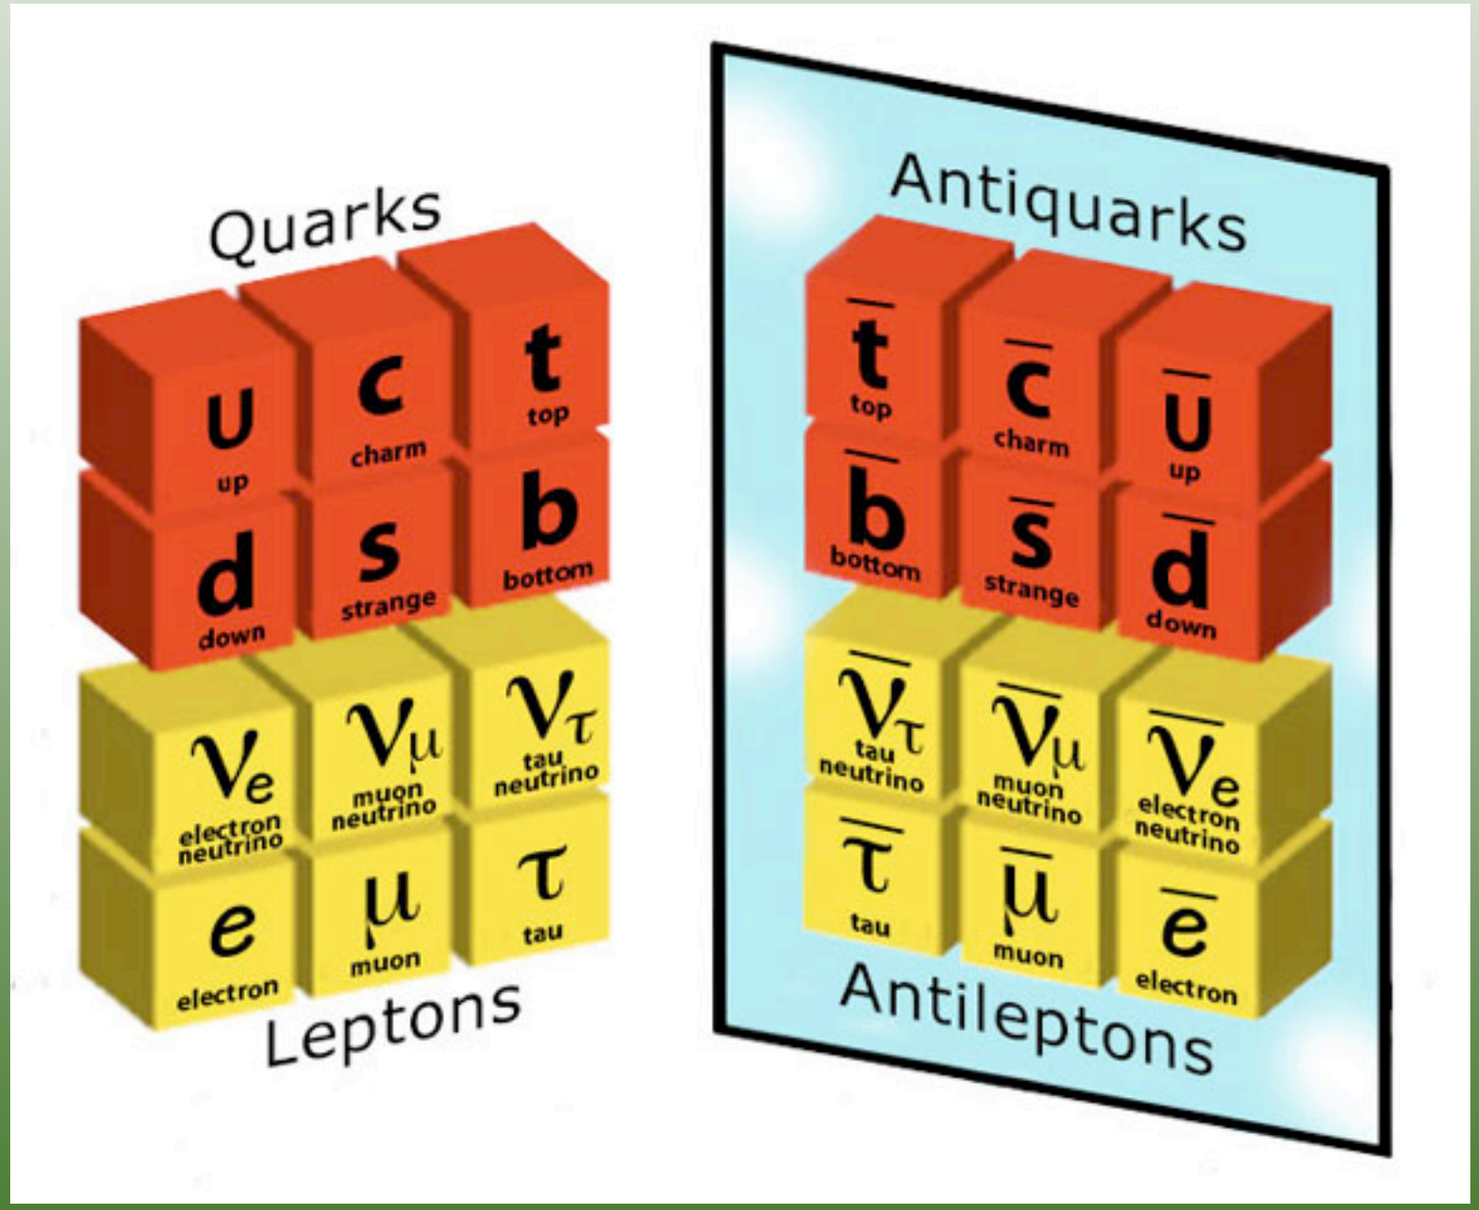
Neutrinos are the only particles to feel *only* this force and gravity.

They are a unique window to understanding this foundational part of our Universe.

Too weak to matter in particle physics

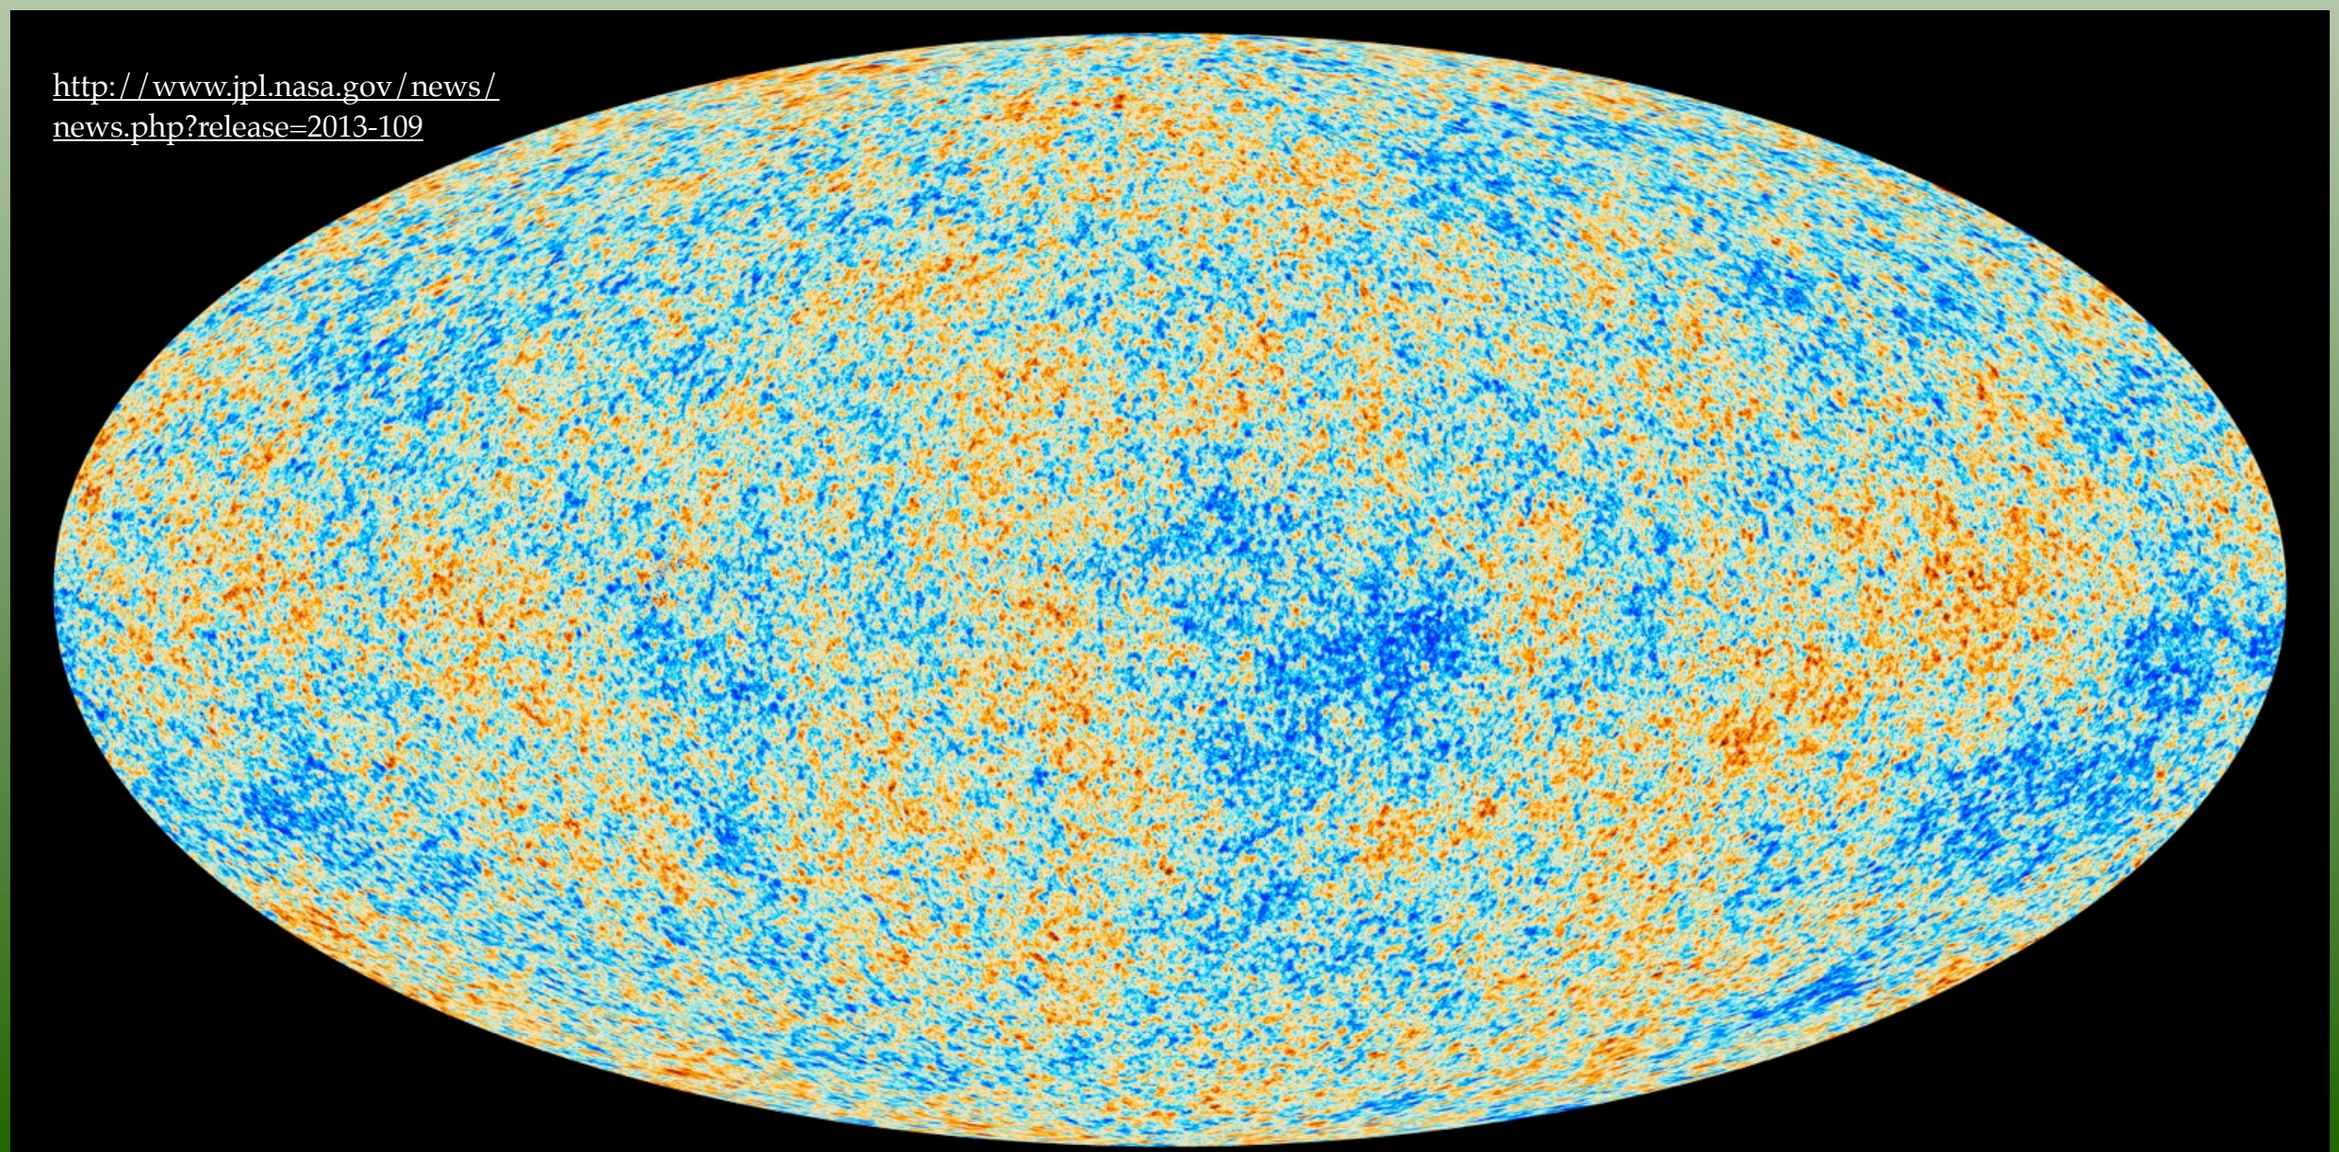
CP Violation

- We think the big bang produced matter and antimatter in equal quantities.
- They must behave slightly differently in order to explain our existence



Why Are We (Still) Here?

✳Matter had a slight (1 part in 10 billion) advantage over antimatter after the big bang. We do not know why. Neutrinos could hold the answer.



Known Unknowns...

✳Do neutrinos violate CP?

★Does this explain the matter dominated Universe?

✳What are the neutrino masses?

✳Why are they so light?

✳Are neutrinos their own antiparticles?

✳Are there more than 3 flavors of neutrino?

✳Can we find the Cosmic *neutrino* background?

✳What can neutrinos tell us about Earth's interior?

"...there are known knowns; there are things we know we know. We also know there are known unknowns; that is to say we know there are some things we do not know. But there are also unknown unknowns -- the ones we don't know we don't know."

- US Secretary of Defense Donald Rumsfeld

Unknown Unknowns

Unknown Unknowns

Neutrinos could and probably do have many more surprises in store.

We do not know what great discoveries await. This is the most exciting part of science!

To those of you who are students, if you become a physicist, you could help answer some of the questions we know how to ask and even those we don't!

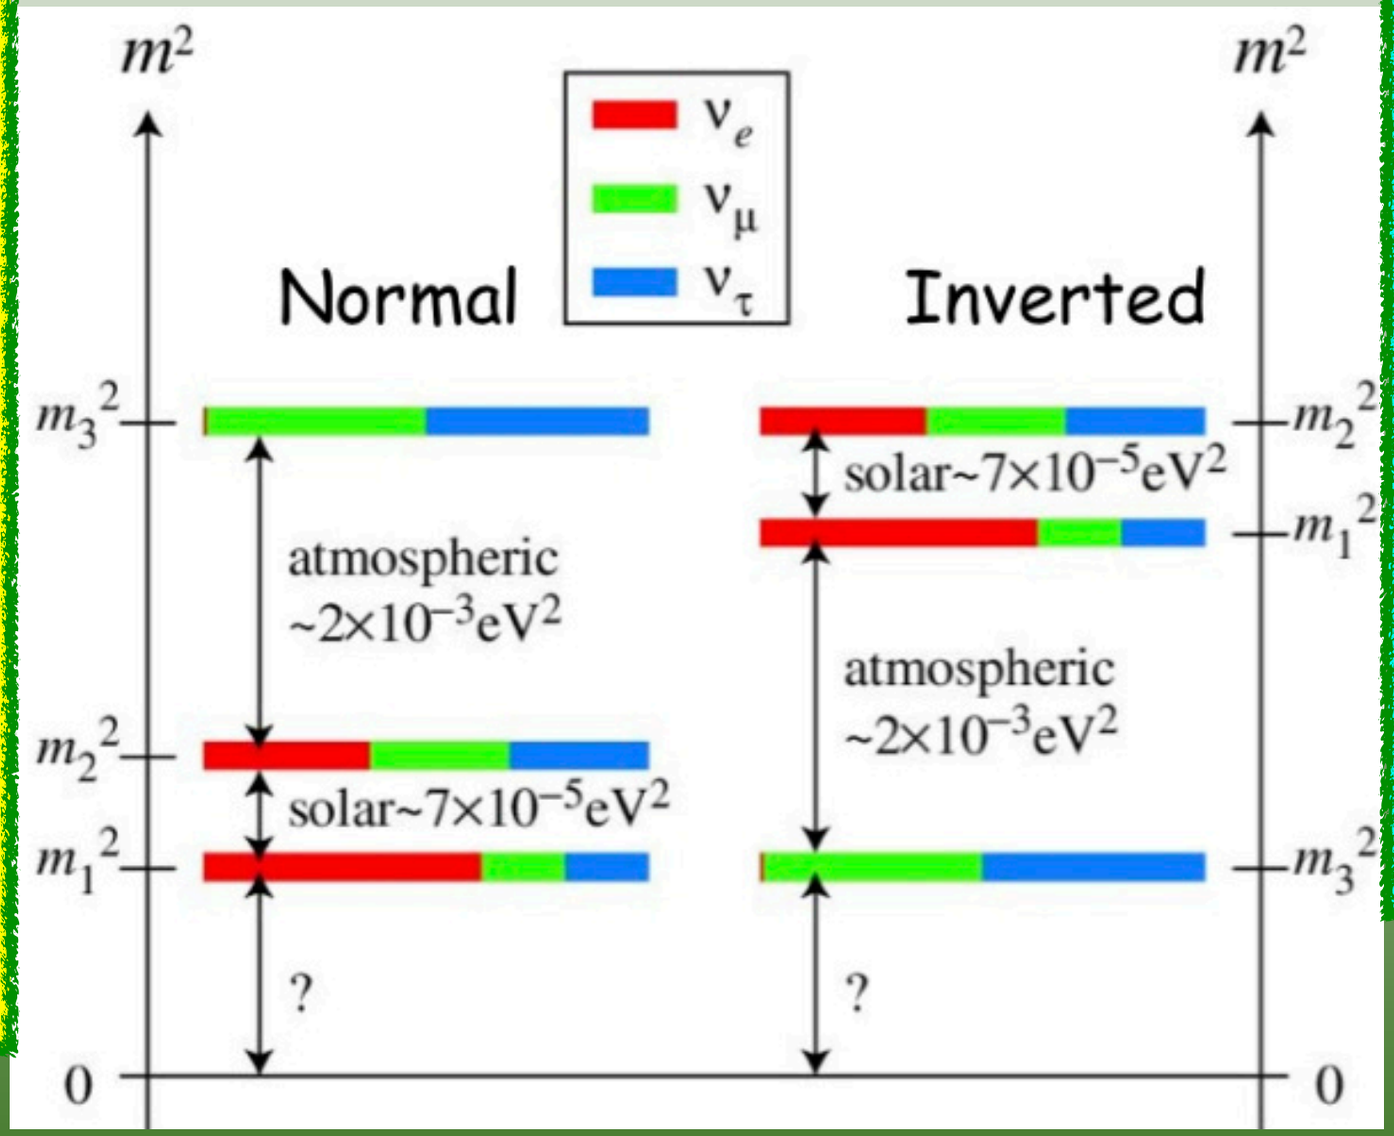
Thank You!

A Problem in the Sun?

- In *The Songs of Distant Earth* by Arthur C. Clarke, the neutrino deficit is a sign the sun will soon explode
- Fortunately, the real answer turns out to be a great relief (and even stranger)...
- Note that Davis' experiment could only detect *one* kind of neutrino

Great, now he's speaking German...

What actually propagates through space are ν_1, ν_2 ,ν_3, which have definite mass and are mixtures of ν_e, ν_μ ,ν_τ



http://neutel11.wordpress.com/2011/03/16/neutrino-mass-models-by-steve-king/

We have measured and are measuring the difference between the masses and the composition of ν_1, ν_2, and ν_3

How light are they
